PT      Purified DNA mol. for diagnosis of porcine malignant hyperthermia
PT      - comprises DNA sequence encoding normal or mutant ryanodine
PT      receptor with specified endonuclease restriction map
PS      Disclosure: Fig 2; 96pp; English.
CC      The sequence given is the mutant pig ryanodine receptor (RYR1) gene
CC      from swine cDNA. The polymorphic sites were observed in comparisons
CC      of Plectrain and Yorkshire breeds. There are 17 polymorphisms between
CC      the two breeds. The polymorphism at position 1972 causes a mutation
CC      from Arg to Cys and this is thought to be the molecular basis of
CC      porcine malignant hyperthermia (MH). This mutation lies within the
CC      region of RYR1 that is concerned with the binding of regulators of Ca2+
CC      release channel gating. Analysis of surrounding sequences suggests
CC      that this mutation lies within a beta strand domain comprising roughly
CC      of amino acids 520 to 830. RYR1 is the calcium release channel of the
CC      sarcoplasmic reticulum and is a large protein which spans the gap
CC      between the transverse tubule and the sarcoplasmic reticulum. The
CC      channel is activated by ATP, calcium, caffeine, and micro-molar
CC      ryanodine. It is inhibited by ruthenium red, tetracaine, calmodulin,
CC      high Mg2+ and ryanodine.

PT Human glutamate receptor protein and nucleic acid - used to  
PT develop therapeutic agents for neurological disorders and  
PT neuro-degenerative diseases  
PS Claim 5: Page 27-31: 42pp: English.  
CC The DNA sequence encodes the human glutamate receptor HSGIUR1. The  
CC cDNA was produced from a culture of E. coli cells contg. the plasmid  
CC pS103 (obtd. from American Type Culture Collection, Rockville  
CC Maryland). The plasmid was digested with restriction enzymes EcoRI  
CC and KpnI to produce a 4.2 kb fragment contg. the entire coding  
CC sequence of the human HSGIUR1 receptor. The receptor can be used to  
CC study interactions of L-glutamate with its receptor and to develop  
CC therapeutic agents for neurological disorders such as stroke,  
CC epilepsy and head trauma and neurodegenerative disorders such as  
CC Alzheimer's disease. Fragments of the DNA sequence may be used as  
CC probes to identify further glutamate receptor genes.

PT - used for providing prods. for use in screening assays or in  
PT detection and/or localisation  
PS Claim 1: Page 15-19: 10pp: English.  
CC The GluR1B receptor DNA is contained within plasmid pBS/humGluR1B  
CC (ATCC 75246) and may be expressed by a mammal recombinant cell. The  
CC cDNA can be used to obtain products for evaluating the human nervous  
CC system and particularly for assessing potentially therapeutic  
CC interactions between the AMPA-binding human excitatory amino acid  
CC receptors and natural and synthetic ligands. It can also be used  
CC for detecting the presence and/or location of human GluR receptors  
CC e.g. in brain tissue. The DNA was isolated from human brain cDNA  
CC libraries using rat GluR receptor gene probes.

 PT Polynucleotides and peptides derived from oploid receptor  
 PT polypeptides for use in therapeutic compositions and in  
 PT screening assays for useful drug substances.  
 PS Claim 6; Page 215-221; 300pp; English.  
 CC The nucleotide sequence of the novel mouse delta oploid receptor gene  
 CC MOR1. The gene was isolated from a mouse brain cDNA library using a  
 CC fragment (amplified from the cDNA library with primers 075929-30) as a  
 CC probe. The primers are based on the conserved sequences present in the  
 CC second and third transmembrane domains of somatostatin (SRII) receptor  
 CC subtypes SSTR1, SSTR2 and SSTR3. The 1.3 kb EcoRI-SacI fragment from the  
 CC mouse delta oploid receptor clone, lambda ms1-2, was subcloned into the  
 CC CMV promoter-based expression vector PCMV-6c. The resultant construct  
 CC PCMV-ms1-2 was transfected into COS-1 cells for protein production. The  
 CC gene encoding the oploid receptor can be used to produce complete,  
 CC truncated or chimeric oploid receptor proteins. The oploid receptors  
 CC thus produced are useful for the development of novel assays designed to  
 CC select or improve substances, capable of interacting with the oploid  
 CC receptor proteins, for use in diagnosis, drug design and therapeutic  
 CC applications.

 PT DNA sequences coding for glutamate receptor sub-unit variants  
 PT useful for the identification of functional ligands for these  
 PT receptors and for preparing anti-sense reagents  
 PS Claim 1; Page 13-18; 74pp; English.  
 CC T02795-802 are DNA sequences encoding variants of the human glutamate  
 CC receptor (gluR) subunits. cDNAs encoding gluR subunits A, B, C, and D,  
 CC were isolated from the brain. There are 2 splice variants, "flip" and  
 CC "flop", for each subunit that are known. It was found that for gluRA,  
 CC gluRB, gluRC and gluRD, the first amino acid of the "flip/flop"-region,  
 CC can be Glycine (G) or Arginine (R), through different RNA splicing.  
 CC For the gluRB subunit, it was found that it is possible to have a  
 CC Glutamine (Q) or an R in the transmembrane domain, before the flip/flop  
 CC region giving a total of 8 possible conformations. The gluRAflpR cDNA  
 CC possesses in comparison to gluRAflpG cDNA, a base change at position  
 CC 2269, a glycine codon (GGA) is converted to an arginine codon (AGA)  
 CC (sic). The same applies for gluRAflopR. Cells transfected with the DNA  
 CC are useful for identifying functional ligands for gluR. Glutamate is  
 CC an important excitatory neurotransmitter in the central nervous system  
 CC and is involved in the pathophysiology of e.g., epilepsy, schizophrenia  
 CC and ischemia. gluR ligands have the potential to be used in the  
 CC treatment of these conditions.

CC	isolated from Helicobacter pylori and encodes a H.pylori GHP protein.					
CC	The polypeptides can be used for preventing or treating Helicobacter					
CC	infections, and gastroduodenal diseases associated with these					
CC	infections, including acute, chronic, and atrophic gastritis, and peptic					
CC	ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used					
CC	for the production of antibodies. The products can also be used for					
CC	detection and diagnosis.

Melanocyte stimulating hormone receptors and corresp. DNA - from
humans and mice, used for diagnosis of genetic disease and for
screening agents
Claim 5; Fig 1B; 46pp; English.

The sequence encodes the human melanocyte-stimulating hormone
receptor isolated from a human melanoma cDNA library using a pair
of degenerate PCR primers corresp. to the putative third and sixth
transmembrane regions of G-protein coupled receptors. The sequence
can be used as a probe for the detection and diagnosis of genetic
diseases, or for the isolation of novel mammalian receptors and genes.
It may also be used for screening and quantitating cnds. as inhibitors

 mailto:sapiens@watson.wustl.edu

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:  
 all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

#### MAPPING INFORMATION:

The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see  
 http://www.nhgri.nih.gov/DIR/GRB/CHR7, send  
 mailto:egreen@nhgri.nih.gov, or see http://genome.wustl.edu/gsc

#### SOURCE INFORMATION:

This clone was derived from human PAC library RPCI-4, prepared by Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bacpac.med.buffalo.edu) using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from one male donor.  
 The clone may be obtained either from Genome Systems, Inc. (http://www.genomesystems.com) or Research Genetics, Inc. (http://www.resgen.com); or from Pieter de Jong.

VECTOR: pCYPAC2  
 NEIGHBORING SEQUENCE INFORMATION:  
 The actual start of this clone is at base position 1 of D0806A17,  
 actual end is at 161667 of D0806A17.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

TITLE The sequence of Homo sapiens clone
JOURNAL Unpublished
AUTHORS Waterston,R.H.
TITLE Direct Submission
JOURNAL Submitted (09-APR-1999) Genome Sequencing Center, Washington
University School of Medicine, 4444 Forest Park Parkway, St. Louis,
MO 63108, USA
COMMENT
* NOTE: This is a 'working draft' sequence. It currently
* consists of 6 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
1 2826: contig of 2826 bp in length
2827 2844: gap of unknown length
2845 9247: contig of 6403 bp in length
9248 9265: gap of unknown length
9266 25233: contig of 15968 bp in length
25234 41277: contig of unknown length
41278 41294: contig of 16027 bp in length
41295 89779: gap of unknown length
89780 89796: gap of unknown length
89797 147724: contig of 57928 bp in length.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

strand CDNA was primed with a Not I - Oligo(dT)15 primer  
15'pGACTGATCTAGATCGCGAGCGCGCCCTTTTCTTTT3';  
double-stranded CDNA was ligated to Sal I adaptors (BRL),  
digested with Not I and cloned into the Not I and Sal I  
sites of the pSPORT1 vector (BRL). Library was constructed  
by Matthew Clark (Lehrach lab, ICRF, London and Max Planck  
Institut fuer Molekulare Genetik, Berlin). cDNAs for EST  
analysis were selected following oligonucleotide  
hybridization fingerprinting of arrayed clones from  
zebrafish late somitogenesis (26 ss), adult liver or  
embryonic shield stage (5.6 h) libraries. Fingerprint  
data were used to computationally cluster cDNAs, and a  
single CDNA from each cluster was chosen for sequencing.  
In some cases multiple members of the same cluster were  
sequenced to assess clustering parameters or single clones  
were sequenced additional times to assess quality  
control."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## COMMENT

Baylor Plaza, Houston, TX 77030, USA  
On Jan 31, 1999 this sequence version replaced gi:4204112.  
INFORMATION: <http://gc.bcm.tmc.edu:8088/home.html> or email  
gc-help@bcm.tmc.edu

CLONE LENGTH: This sequence does not necessarily represent the  
entire insert of this clone. Overlapping regions of clones are only  
sequenced and submitted once, so the sequence for the remainder of  
the insert may be found in the record for the adjacent clones.  
Overlapping clones are noted at the beginning and end of the  
Features listing.

## ANNOTATION OF FEATURES:

STS are identified using ePCR (Genome Res. 7:541-550) searches  
of a local database that includes entries from dbSTS, GDB, and  
local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green,  
unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST  
(Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the  
EST and cDNA sequences. Genes demonstrate at least two exons  
flanked by consensus splice sites that maintained sequence  
continuity across the splice junctions. Sequences that are not  
identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum  
standard of double strand coverage with a minimum of 2 clones and 2  
reads with no ambiguities or 2 chemistries with a minimum of 2  
clones and 3 reads with no ambiguities. If the sequence quality for  
a region does not meet this standard, it will be indicated in the  
annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality  
standards - estimated error rate less than 1 per 10,000 bases.

Version: 1.01 gxfco.

               Based upon the presence of a XhoI site followed by a run of 14 or
               more T residues at the beginning of the sequence, this clone was
               polyadenylated. The resulting Poly-T sequence has been removed.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Print. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

PT Colon-specific nucleic acids - useful as probes for detecting colon  
PT Cancer micrometastases  
PS Claim 15; Fig 5A-B; 51pp; English.  
CC V16668-81 represent polynucleotide sequences of partial or full-length  
CC cDNA clones of colon-specific genes. The polynucleotides can be used  
CC as probes to detect expression of the corresponding human genes, e.g. in  
CC diagnostic assays for detecting micrometastases of colon cancer.  
CC Recombinant cells containing the polynucleotides can be used to  
CC produce the polypeptides, in order that antibodies can be raised and  
CC used in further screening or diagnostics.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.  
PT for diagnosis of abnormal cell function, by preparing cDNA that  
PT reflects relative abundance of corresp. mRNA in specific human  
PT tissues  
PS Claim 1: Page 1138-1139; 2245pp; Japanese.  
CC A single-stranded DNA (or its complementary strand or the corresp.  
CC double-stranded DNA) which comprises one of the 7837 "GS" sequences  
CC given in T19001-T26837 and which is able to hybridize to part of  
CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)  
CC sequences were obtained from 3'-directed cDNA libraries prepared  
CC from various human tissues; synthesis of cDNA was initiated from the  
CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-  
CC untranslated sequence is unique to a particular mRNA species, almost  
CC all the 3'-oriented cDNAs hybridize with specific mRNAs. Each library  
CC is constructed so as to reflect accurately the relative abundance of  
CC different mRNAs in the particular tissue from which it was derived.

CC cadherin/tumour invasion suppressor activity, tumour inhibition  
CC activity. The polynucleotide may also be useful for gene therapy.

PT New Polynucleotides encoding human secreted proteins - derived from  
PT e.g. human blood, kidney, foetal lung, placenta, testes, brain,  
PT ovary, pituitary, retina and colon cDNA libraries.  
PS Claim 1, Page 192; 618bp; English.  
CC The present sequence represents a human expressed sequence tag (EST).  
CC The polynucleotide, which is a secreted EST, and the encoded protein  
CC are predicted to have useful biological activities which would make  
CC them suitable for treating, preventing or ameliorating medical  
CC conditions in humans and animals, although no supporting data is  
CC given. Suggested activities include nutritional activity, immune  
CC stimulating or suppressing activity, haematopoiesis regulating  
CC activity, tissue growth activity, activin/inhibin activity,  
CC chemotactic/chemokinetic activity, haemostatic and thrombolytic  
CC activity, receptor/ligand activity, anti-inflammatory activity,  
CC cadherin/tumour invasion suppressor activity, tumour inhibition  
CC activity. The polynucleotide may also be useful for gene therapy.

PS Claim 1: page 15: 20pp; Japanese.  
CC The sequence shows the cDNA sequence of the guinea pig major basic  
CC protein (MBP)-1 gene. The sequence was obt. by first isolating MBP-1  
CC and MBP-2 from the abdominal transudate of male guinea pigs treated  
CC with polymyxin and ascaris extract. MBP-1 and MBP-2 were used to  
CC design probes for screening of a guinea pig eosinophil cDNA library.  
CC The MBPs may be pred. in large amounts by this method and may be  
CC used for the confirmation of the effect of an anti-asthma drug.  
CC See also Q31989-93.

PT Chimeric human interferon-gamma receptor/immunoglobulin proteins  
PT - used to inhibit binding of interferon-gamma to its specific  
PT receptor in the treatment of illnesses  
PS Disclosure: Figure 1: 29pp; English.  
CC The soluble form of the Interferon (IFN) gamma receptor comprises  
CC the whole extracellular domain of the natural receptor from the N-  
CC terminus to the transmembrane region, lacks the cytoplasmic and  
CC transmembrane domains of the natural receptor and specifically binds  
CC IFN-gamma. The sequence encoding the soluble IFN-gamma receptor can  
CC be used in constructs encoding chimeric proteins where the other  
CC component of the chimeric protein is part of all of the constant  
CC domain of a human immunoglobulin heavy or light chain. The  
CC recombinant proteins can be used to inhibit IFN-gamma binding to its  
CC specific receptor. They can be used for the treatment of  
CC illnesses, especially autoimmune diseases, chronic inflammation,  
CC delayed type hypersensitivity, allotransplant rejections, multiple  
CC sclerosis, fulminant hepatitis, inflammatory neurological diseases  
CC and neurological complications of AIDS, poliovirus infections, Lyme  
CC disease and septicemia. The presence of the immunoglobulin  
CC component in the chimeric protein increases the proteins half life in  
CC vivo.

 PT Diagnosing and genotyping of hereditary haemochromatosis (HH) -  
 PT using primers to detect specific polymorphisms of the HH gene on  
 PT chromosome 6p2.1 or novel microsatellite markers  
 PS Disclosure: Fig 1Y: 67pp; English.  
 CC The sequences given in T43925-55 represent portions of the genome  
 CC surrounding several markers of the invention. The markers were  
 CC identified using the series of primer pairs given in T71901-72  
 CC which were used to determine the presence or absence of the common  
 CC hereditary haemochromatosis (HH) gene mutation in an individual. The  
 CC method comprised assessing genomic DNA from an individual for the  
 CC presence or absence of the HH-associated allele of the single base-pair  
 CC polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optional  
 CC marker comprising the following microsatellite repeat alleles of group  
 CC A and optionally of group B:  
 CC Group A: 1909, 1884, 1A2, 1E4, 24E2, 2B8, 3321-1, 4073-1, 4440-1, 4440-2,  
 CC 711-1, 5091-1, 3216-1, 4072-2, 950-1, 950-3, 950-4, 950-5, 950-6,  
 CC 950-8, 63-2, 63-3, 65-1, 65-2, 373-8, 373-29, 68-1, 241-6, 241-29;  
 CC Group B: D6S464, D6S306, D6S258, D6S265, D6S105 and D6S1001.  
 CC The absence of the genotype indicates the likelihood of the presence of  
 CC the HH mutation. Knowledge of the new genetic markers allows the  
 CC definition of genotypes characteristic of heterozygous carriers and  
 CC homozygotes having a HH mutation in their genomic DNA. The potential for  
 CC HH in an individual interferes with the effectiveness of interferon  
 CC treatment for hepatitis C infection. By diagnosing this potential, the  
 CC responsiveness of interferon treatment may be evaluated.

 PT Nucleic acid molecule encoding vertebrate pheromone receptor -  
 PT useful to identify modulators for control of reproductive and social  
 PT behaviour, fertility and hormone secretion  
 PS Claim 1; Fig 8; 123pp; English.  
 CC A cDNA clone (T69545) codes for rat pheromone receptor VNI  
 CC (W19103), a member of a novel family of presumed 7-transmembrane  
 CC domain receptors that are evolutionary independent of the odorant  
 CC receptors of the main olfactory epithelium (MOE). It was isolated  
 CC by differential screening of cDNA libraries constructed from rat  
 CC single vomeronasal sensory neurons. A VNI insert in pBluescript  
 CC has been deposited as ATCC 97294. VNI is expressed only in about  
 CC 4% of VSN and never in the MOE. cDNA clones for VN2-7 were obt.  
 CC by PCR and hybridisation (see also T69546-50. VN2 sequence not  
 CC given). VN polypeptides (W19103-09) can be expressed in host-  
 CC vector systems for use in identifying modulators for control of  
 CC maternal, reproductive and social behavior, to increase fertility,  
 CC control hormone secretion and to regulate food uptake in humans and  
 CC animals. A human homologue, H625 (T69551), has also been obt.

PT Nucleic acid encoding peripheral nervous system specific sodium
PT channel peptide - useful for sodium channel-associated disease or
PT trauma.
PS Example 4; Fig 13; 80pp; English.
CC The sequence encodes a human peripheral nervous system sodium channel
CC peptide-1 alpha-subunit (PNIA), with sodium channel activity. A
CC probe has been isolated by PCR from a human peripheral nervous
CC system cDNA library, using probes derived from the rat PNI protein
CC sequence (R99638-39), and has been used to screen a human dorsal
CC root ganglion cDNA library, to give the full-length sequence, using
CC PCR primers T30198-99 and T18167. A related sequence (T30195) has
CC also been isolated. The sodium channel peptide may be used to
CC isolate sodium-agonists and sodium-antagonists for use as
CC analgesics, hypotensives, antiinflammatorys, and in therapy of
CC sodium channel-associated pathology or trauma, e.g. neurological
CC disorders. The DNA (in sense or antisense orientation) may be used
CC in gene therapy.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Xho I; Lymphatic filarial nematode parasite of humans.  
mRNA was prepared from microfilariae of Brugia malayi  
isolated from jirds and converted to double stranded cDNA  
using reverse transcriptase and oligo(dT) followed by  
RNase H and DNase I. The library had 3.5 x 10E5  
independent recombinants and average insert size was 900  
base pairs. The library was constructed by Lori Saunders.  
The library is available from Dr. S.A. Williams, email  
genome@smith.edu."

COMMENT	On May 12, 1999 this sequence version replaced gi:4757680. * NOTE: This is a 'working draft' sequence. It currently * consists of 9 contigs. The true order of the pieces * is not known and their order in this sequence record is * arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. * This record will be updated with the finished sequence * as soon as it is available and the accession number will * be preserved.			
	1	1596: contig of 1596 bp in length

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 3
AB017156 2937 bp mRNA ROD 04-MAR-1999
DEFINITION Mus musculus gob-5 mRNA, complete cds.
ACCESSION AB017156
NID 93721911
VERSION AB017156.1 GI:3721911
KEYWORDS GOB-5
SOURCE Mus musculus adult intestine goblet cell cDNA to mRNA.
ORGANISM Mus musculus
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;
Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus.
REFERENCE 1 (sites)
AUTHORS Komiyama, T., Tanigawa, Y. and Hirohashi, S.

```

TITLE Cloning and identification of the gene gob-5, which is expressed in intestinal goblet cells in mice

JOURNAL Biochem. Biophys. Res. Commun. 255 (2), 347-351 (1999)

MEDLINE 99160866

REFERENCE 2 (bases 1 to 2937)

AUTHORS Komiyama, T., Tanigawa, Y. and Hirohashi, S.

TITLE Direct Submission

JOURNAL Submitted (26-AUG-1998) to the DDBJ/EMBL/GenBank databases. Tohru Komiyama, ESATO, JST, Hirohashi Cell Configuration Project: 5-9-9, Tokodai, Tsukuba, Ibaraki 300-2635, Japan (E-mail:tkom@ccp.jst.go.jp, Tel:81-298-47-7563, Fax:81-298-47-5226)

PT cancer micrometastases
PS Claim 15; Fig 5A-B; 51pp; English.
CC V16668-81 represent polynucleotide sequences of partial or full-length
CC cDNA clones of colon-specific genes. The polynucleotides can be used
CC as probes to detect expression of the corresponding human genes; e.g. in
CC diagnostic assays for detecting micrometastases of colon cancer.
CC Recombinant cells containing the polynucleotides can be used to
CC produce the polypeptides, in order that antibodies can be raised and
CC used in further screening or diagnostics.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.  
 PT for diagnosis of abnormal cell function, by preparing cDNA that  
 PT reflects relative abundance of corresp. mRNA in specific human  
 PT tissues.  
 CC A single-stranded DNA (or its complementary strand or the corresp.  
 CC double-stranded DNA) which comprises one of the 7837 "GS" sequences  
 CC given in T19001-T26837 and which is able to hybridise to part of  
 CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)  
 CC sequences were obtained from 3'-directed cDNA libraries prepared  
 CC from various human tissues; synthesis of cDNA was initiated from the  
 CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-  
 CC untranslated sequence is unique to a particular mRNA species, almost  
 CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library  
 CC is constructed so as to reflect accurately the relative abundance of  
 CC different mRNAs in the particular tissue from which it was derived.  
 CC The appearance frequency of a given GS in a cDNA library can be  
 CC determined (esp. using primers and probes derived from the GS  
 CC sequences) as a means of diagnosing abnormal cell function or for  
 CC recognising different cell types.

PR Complete genome sequence of methano-genic archaeon, Methanococcus jannaschii - useful in identification of M. jannaschii genome  
PT fragment  
PS Claim 13; Page 152-585; 614pp; English.  
CC The present sequence represents the complete 1.66-megabase pair genome sequence of the Methanococcus jannaschii circular chromosome. The present invention describes M. jannaschii open reading frames from the genome sequence. The invention also describes a computer based system for identifying fragments of the M. jannaschii genome that are homologous to target nucleotide sequences, comprising: (a) data storage means comprising the nucleotide sequence of the 1664976, 58407 or 16550 bp sequence (see V21209, V21210 and V21211), or a nucleotide sequence at least 99.9% identical to it; (b) search means for comparing a target sequence to the nucleotide sequence of the data storage means to identify a homologous sequence, and (c) retrieval means for obtaining the homologous sequence. The method, which is based on whole genome random sequencing of an autotrophic archaeon M. jannaschii, the genome of which consists of 3 physically distinct elements, a large circular chromosome (the 1664976 bp sequence given in V21209), a large circular extra-chromosomal element (the 58407 bp sequence given in V21210), and a small circular extra-chromosomal element (the 16550 bp sequence given in V21211), can be used in the identification of M. jannaschii genome  
CC fragment.

PT New nucleic acid sequences from Staphylococcus aureus MCHU29 - useful in vaccines and for treatment of bacterial infections of e.g. respiratory tract and central nervous system  
PS Claim 1; Page 69-70; 390pp; English.  
CC This sequence encodes a Staphylococcus aureus protein of unknown function, and represents a DNA sequence of the invention.  
CC The DNA sequences were isolated from Staphylococcus aureus MCHU29 (NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the CC proteins are used for the inhibition of bacterial polypeptides.  
CC Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, central nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

 PT screening assays for useful drug substances.

PS Clam 6; Page 215-221; 300pp; English.  
 CC The nucleotide sequence of the novel mouse delta opioid receptor gene  
 CC MOR1. The gene was isolated from a mouse brain cDNA library using a  
 CC fragment (amplified from the cDNA library with primers Q75929-30) as a  
 CC probe. The primers are based on the conserved sequences present in the  
 CC second and third transmembrane domains of somatostatin (SSTR) receptor  
 CC subtypes SSTR1, SSTR2 and SSTR3. The 1.3 kb EcoRT-SacI fragment from the  
 CC mouse delta opioid receptor clone, lambda ms1-2, was subcloned into the  
 CC CMV promoter-based expression vector pCMV-6c. The resultant construct  
 CC pCMV-ms1-2 was transfected into COS-1 cells for protein production. The  
 CC gene encoding the opioid receptor can be used to produce complete,  
 CC truncated or chimaeric opioid receptor proteins. The opioid receptors  
 CC thus produced are useful for the development of novel assays designed to  
 CC select or improve substances, capable of interacting with the opioid  
 CC receptor proteins, for use in diagnosis, drug design and therapeutic  
 CC applications.

PT DNA sequences coding for glutamate receptor sub-unit variants -  
 PT useful for the identification of functional ligands for these  
 PT receptors and for preparing anti-sense reagents  
 PS Clam 1; Page 13-18; 71pp; English.

CC T02795-802 are DNA sequences encoding variants of the human glutamate  
 CC receptor (GluR) subunits. cDNAs encoding GluR subunits A, B, C, and D,  
 CC were isolated from the brain. There are 2 splice variants, "flip" and  
 CC "flop", for each subunit that are known. It was found that for GluRA,  
 CC GluRB, GluRC and GluRD, the first amino acid of the "flip/flop"-region,  
 CC can be Glycine (G) or Arginine (R), through different RNA splicing.  
 CC For the GluRB subunit, it was found that it is possible to have a  
 CC glutamine (Q) or an R in the transmembrane domain, before the flip/flop  
 CC region giving a total of 8 possible conformations. The GluRAfl1pR cDNA  
 CC possesses in comparison to GluRAfl1pG cDNA, a base change at position  
 CC 2269, a glycine codon (GGA) is converted to an arginine codon (AGA)  
 CC (sic). The same applies for GluRAfl1pR. Cells transfected with the DNA  
 CC are useful for identifying functional ligands for GluR. Glutamate is  
 CC an important excitatory neurotransmitter in the central nervous system  
 CC and is involved in the pathophysiology of e.g., epilepsy, schizophrenia  
 CC and ischaemia. GluR ligands have the potential to be used in the  
 CC treatment of these conditions.

PT	Purified DNA mol. for diagnosis of porcine malignant hyperthermia
PT	- comprises DNA sequence encoding normal or mutant ryanodine
PT	receptor with specified endonuclease restriction map
PS	Disclosure; Fig 2; 96pp; English.
CC	The sequence given is the mutant pig ryanodine receptor (RYR1) gene
CC	from swine cDNA. The polymorphic sites were observed in comparisons
CC	of Pietrain and Yorkshire breeds. There are 17 polymorphisms between
CC	the two breeds. The polymorphism at position 1972 causes a mutation
CC	from Arg to Cys and this is thought to be the molecular basis of
CC	porcine malignant hyperthermia (MH). This mutation lies within the
CC	region of RYR1 that is concerned with the binding of regulators of Ca <sup>2+</sup>
CC	release channel gating. Analysis of surrounding sequences suggests
CC	that this mutation lies within a beta strand domain comprising roughly
CC	of amino acids 520 to 830. RYR1 is the calcium release channel of the
CC	sarcoplasmic reticulum and is a large protein which spans the gap
CC	between the transverse tubule and the sarcoplasmic reticulum. The
CC	cannel is activated by ATP, calcium, caffeine, and micro-molar
CC	ryanodine. It is inhibited by ruthenium red, tetracaine, calmodulin,
CC	high Mg <sup>2+</sup> and ryanodine.

PT Complex recombinant DNA - contains DNA sequence for L-dopa prodn. from  
benzene, and beta-tyrosinase gene.  
PS Claim 1; page 502-3; 20pp; Japanese.  
CC The DNA (region III) forms part of a complex recombinant DNA which also  
contains gene regions I, II and IV and a beta-tyrosinase gene.  
CC The DNA encodes an enzyme protein. Regions I - IV make up a catechol  
producing gene derived from bacteria such as Pseudomonas. The beta  
tyrosinase gene is derived from bacteria such as Erwinia herbicola and  
Aerobacter aerogenes. Bacteria transformed with the recombinant  
DNA are capable of producing catechol from benzene, and have beta-  
tyrosinase activity. Using the transformant, L-dopa can be produced  
from benzene cheaply and safely. L-dopa is used as a remedy for  
Parkinson's disease.

 PT Enriched oligonucleotides and corresp. sequences - used as  
 PT markers for human genes transcribed in-vivo, facilitate tagging  
 PT of most human genes  
 PS Example 4: Page 418: 500pp: English.  
 CC The Expressed Sequence Tag was isolated from a human brain cDNA  
 CC library as part of a large set of ESTs which can be used as markers  
 CC for human genes transcribed in vivo. They can be used to facilitate  
 CC tagging of most human genes, for mapping locations of expressed genes  
 CC on chromosomes, for individual or forensic identification, for mapping  
 CC locations of disease-associated genes, for identification of tissue  
 CC type and for prep. of antisense sequences, probes and constructs.  
 CC EST01042 has a "poor" coding probability as evaluated using the  
 CC coding-region prediction program CRM. See also Q59041-Q61440.

PT Nucleic acid molecule encoding vertebrate pheromone receptor -
PT useful to identify modulators for control of reproductive and social
PT behaviour, fertility and hormone secretion
PS Claim 1; Fig 8; 123p; English.
CC A cDNA clone (T69545) codes for rat pheromone receptor VNI
CC (W19103), a member of a novel family of presumed 7-transmembrane
CC domain receptors that are evolutionary independent of the odorant
CC receptors of the main olfactory epithelium (MOE). It was isolated
CC by differential screening of cDNA libraries constructed from rat
CC single vomeronasal sensory neurons. A VNI insert in pBluescript
CC has been deposited as ATCC 97294. VNI is expressed only in about
CC 4% of VSN and never in the MOE. cDNA clones for VN2-7 were obtd.
CC by PCR and hybridisation (see also T69546-50, VN2 sequence not
CC given). VN polypeptides (W19103-09) can be expressed in host-
CC vector systems for use in identifying modulators for control of
CC maternal, reproductive and social behavior. to increase fertility,
CC control hormone secretion and to regulate food uptake in humans and
CC animals. A human homologue, Hg25 (T69551), has also been obtd.

## COMMENT

Submitted (16-MAR-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, USA  
 On Jun 1, 1999 this sequence version replaced gi:4803907.  
 For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (<http://www.fruitfly.org/sequence/>) or send email to [dbgap@fruitfly.berkeley.edu](mailto:dbgap@fruitfly.berkeley.edu). All contigs in this submission meet the following cutoffs: length >= 400 bases, phrap computed error rate <= 1/10.

\* NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as \* runs of N, but the exact sizes of the gaps are unknown. \* This record will be updated with the finished sequence \* as soon as it is available and the accession number will be preserved.

## FEATURES

once, or longer because we arrange for a small overlap between neighbouring submissions.  
 The true left end of clone B42B1 (Z75890) is at 21055 in this sequence. The true left end of clone 732B4 (AL008722) is at 113044. The true right end of clone B42B1 is at 62012.  
 This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key.  
 This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 Mapping group. Further information can be found at <http://www.sanger.ac.uk/HGP/Chr22>  
 544A11 is from the human BAC library described in U-J. Kim et al. (1996) Genomics 34, 213-218. VECTOR: pBelBAC11.

## Overlapping Sequences:

5' : UMGc:y3c028 (Genbank Accession: AC004210)  
3' : UMGc:y3c018 (Genbank Accession: AC004204)

## Sequence Quality Assessment:

This entry has been annotated with sequence quality estimates computed by the Phrap assembly program. All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp. Base-by-base quality values are not generally visible from the Genbank flat file format but are available as part of this entry's ASN.1 file.

Double stranded (DS) coverage: 76.68  
DS or two chemistry coverage: 99.98  
Single stranded regions: 2

## Sequence Validation:

This sequence has been validated by Multiple Complete Digest Mapping. Comparison of the experimentally derived map digest fragments with sequence-predicted fragments is given below. Small fragments below a variable cutoff (approximately 400-600bp) are not mapped and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragment groups are separated by dashed lines.

TITLE
JOURNAL Direct Submission
REFERENCE Submitted (02-DEC-1998) Whitehead Institute/MIT Center for Genome
AUTHORS Research, 320 Charles Street, Cambridge, MA 02141, USA
On Dec 2, 1998 this sequence version replaced qt:3935222.
All repeats were identified using RepeatMasker: Smtt, A.F.A. &
Green, P. (1996-1997)
http://ftp.genome.washington.edu/RM/RepeatMasker.html

COMMENT
Only the last 197915 base pairs of this clone are being submitted.
The remainder overlaps accession number AC005548 (MIGR project
L361).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT	DNA encoding osteoblast-testicular protein tyrosine kinase					
PT	polypeptide - useful for producing recombinant polypeptide					
PS	Claim 1: Columns 23-24; 31pp; English.					
CC	The present sequence represents a rat osteotesticular protein tyrosine					
CC	phosphatase (OST-PTP) cDNA which was isolated from the fetal rat					
CC	calvaria and the rat osteosarcoma cell line, UMR106. OST-PTP is a					
CC	transmembrane protein expressed only in bone and testis. The OST-PTP					
CC	CDNA is useful for producing recombinant protein. The invention also					
CC	provides a truncated osteoblast specific form (OST) containing the					
CC	OST-PTP receptor but lacking the catalytic domain. The OST-PTP protein					
CC	is claimed to be useful in assays used for screening abnormal bone					
CC	growth patterns and metabolic bone diseases. The OST-PTP protein is					
CC	also claimed to be useful in the treatment of osteoporosis, osteopetrosis					
CC	and other bone metabolic disorders.

PT New CDR-grafted anti carcinoembryonic antigen antibodies - useful  
PT in therapy and diagnosis of carcinoma  
PS Example 4; Fig 11; 70pp; English.  
CC This heavy chain sequence comprises a human framework (i.e. the LAY  
CC region) which contains murine sequences (from the murine anti-CEA  
CC A5b7 Mab) in the CDRs and at other positions predicted to be  
CC important for antigen-binding and at which human and A5b7 sequences  
CC differ. The GH2 heavy chain encoded by this sequence has murine  
CC CDRs at residues 26-35 (CDR1), 50-65 (CDR2) and 95-102 (CDR3) and  
CC additional murine residues within the framework at residues 1, 48,  
CC 49, 72, 73, 76, 82b, 86 and 93. Numbers apply to the mature variable  
CC region. (See Q020984 for A5b7 heavy chain coding sequence).

PS Example 6; Page 121-122; 182pp; English.  
CC A two-component system for anti-tumour therapy comprises a targeting  
CC moiety linked to a mutated enzyme which can transform an anti-neoplastic  
CC prodrug. The system is based on antibody directed enzyme product therapy  
CC (ADEPT) using a non-naturally occurring mutant form of a host enzyme,  
CC (pref. human pancreatic ribonuclease (HP-RNase), (see T42478-83). The  
CC targeting moiety can be an antibody, in partic. murine monoclonal  
CC antibody A5b7 (which binds to human carcinoembryonic antigen) A5b7 is  
CC suitable for targeting colorectal carcinoma. Fragments, esp. F(ab')2,

CC of the antibody can be conjugated to HP-RNase A5B7 Fd and L chain  
CC fragments were isolated by PCR using cDNA isolated from A5B7 hybridoma  
CC cells. The present sequence encodes a humanised A5B7 Fd fragment.

 PT New interleukin-18 binding protein - useful for treating human  
 diseases, including autoimmune disease and inflammation  
 PS Disclosure: Page 60-63; 100pp: English.  
 CC The present sequence comprises human interleukin-18 binding protein  
 CC (IL-18BP) genomic DNA. It was produced from 5 genomic clones  
 CC isolated from a human genomic library by screening with full-length  
 CC human IL-18BP cDNA. No exon coding for a transmembrane receptor  
 CC was identified within the 7.8 kb sequence. 4 Splice variant clones  
 CC (see X24749-52) were identified that code for putative soluble  
 CC secreted proteins, designated IL-18BPa-d (see W98004-007). The  
 CC IL-18BP locus contains an additional gene, coding for the nuclear  
 CC mitotic apparatus protein 1 (NUMA1), positioned on the minus strand  
 CC than localised the IL-18BP gene to human chromosome 11q13(36).  
 CC IL-18BP polypeptides capable of binding IL-18 and/or modulating  
 CC and/or blocking IL-18 activity are provided by the invention.  
 CC Methods for their isolation and recombinant production, DNA vectors  
 CC expressing them, vectors useful for their expression in humans and  
 CC other mammals, and antibodies against them are also provided.  
 CC IL-18BP polypeptides, and DNA encoding them, can be used to treat  
 CC conditions requiring the protein (claimed). Such conditions  
 CC include autoimmune diseases, type I diabetes, rheumatoid arthritis,  
 CC graft rejections, inflammatory bowel disease, sepsis, multiple  
 CC sclerosis, ischemic heart diseases, ischemic brain injury, chronic  
 CC hepatitis, peristalsis, and chronic/acute pancreatitis. IL-18BP is  
 CC also useful for purifying IL-18 (claimed).

PT Prediction of the active site in physiologically active  
PT polypeptide - by determ. of sec. structure energy values of  
PT partial regions along prim. sequence of physiologically active  
PT polynucleotide, etc.  
PS Disclosure: Page 23-24: 43pp; Japanese.  
CC This sequence represents a polynucleotide which was used to  
CC demonstrate the method of the invention. This oligomer represents  
CC an active site/region and the method of the invention may be used to  
CC predict the active site of a polynucleotide by determining the energy  
CC values of the secondary structure of various partial regions of the  
CC polynucleotide to be tested and the primary sequence as well. At  
CC least one partial region should show a local peak energy value  
CC significantly higher or lower than the average standard energy value.  
CC This method may be used in the elucidation of the mechanism of  
CC action of polynucleotides or polypeptides, and in the engineered  
CC improvement of such sequences.

PT Novel Streptococcus pneumoniae proteins and related DNA - useful for
PT diagnosing anti-microbial agents for treatment of bacterial
PT infections
PS Claim 4; Page 198; 483pp; English.
PS This sequence encodes a Streptococcus pneumoniae protein of unknown
CC function, and represents a DNA sequence of the invention.
CC The DNA sequences were isolated from Streptococcus pneumoniae strain
CC 0100993 (NCIMB 40794). The Streptococcus pneumoniae proteins of the
CC invention can be used to identify compounds which interact with and
CC inhibit or activate the activity of the proteins. Antagonists can be
CC used to treat diseases caused by S. pneumoniae proteins, through genetic
CC immunisation. They can also be used to induce an immunological response
CC in a mammal by inoculation with the S. pneumoniae proteins or delivery
CC of the encoding nucleic acids in a vector adequate to produce antibody
CC and/or T cell immune responses to protect the animal from disease. The
CC proteins can also be used to identify antimicrobial compounds which are
CC capable of inhibiting their bioactivity. In particular the proteins of
CC the invention can be used to prevent adhesion of bacteria to mammalian
CC extracellular matrix proteins on in-dwelling devices or in wounds, to
CC block protein-mediated mammalian cell invasion, and to block the normal
CC progression of pathogenesis in infections initiated other than by the
CC implantation of in-dwelling devices or other surgical techniques.

PT New nucleic acids encoding psychosis protecting peptide and

PT antibodies - for the treatment, diagnosis and research of

PT psychotic disorders, such as schizophrenia

PS Claim 1; Page 50-51; 87 pp; English.

CC A subtracted cDNA library was generated from the RNA of lymphocytes

CC obtd. from monozygotic twins discordant for schizophrenia. The two

CC oligos used in library construction were T7 promoter and Sp6

CC promoter (see Q75091, Q75092). A cDNA library was made for each

CC twin and subtractive hybridisation was achieved. Both libraries

CC were used as driver and substrate in two separate subtraction

CC assays. Clone pOKSc was differentially expressed. The expression

CC of the clone was greatest in the 'well' twin. It contains the 3'

CC of a previously unreported gene. It has the closest homology with

CC Varicella-Zoster virus, as 80.0% identity in 26 bp overlap. This

CC cDNA is also expressed in rodent brain in the following areas:

CC cortex, hippocampus and medial geniculate nucleus.

CC Sequence 423 BP; 122 A; 91 C; 102 G; 108 T;

PT New isolated human genes and the secreted polypeptides they encode  
PT - useful for diagnosis and treatment of e.g. cancers, neurological  
PT disorders, immune diseases, inflammation or blood disorders  
PT Claim 1: Page 277; 447bp: English.  
CC This sequence represents a nucleic acid molecule which encodes a secreted  
CC human protein. The gene number, and the clone it is derived from, are  
CC detailed in the descriptor line. The gene can be used to generate fusion  
CC proteins by linking to the gene to a human immunoglobulin Fc portion  
CC (e.g. V3415) for increasing the stability of the fused protein as  
CC compared to the human protein only.  
CC The invention relates to 70 novel genes and their fragments (nucleic acid  
CC sequences: V34154-V34275; amino acid sequences W75057-W75179) which  
CC are useful for preventing, treating or ameliorating medical conditions  
CC e.g. by protein or gene therapy. Also, pathological conditions can be  
CC diagnosed by determining the amount of the new polypeptides in a sample  
CC or by determining the presence of mutations in the new polynucleotides.  
CC Specific uses are described for each of the 70 polynucleotides, based on  
CC which tissues they are most highly expressed in (see V34154 for described  
CC uses).

WARNING: There is evidence that suggests that the 384-well parent  
 plate of this clone contains both human and mouse derived clones.  
 Thus, the origin of this clone is uncertain. This caution should be  
 kept in mind should you use this clone.

This clone is available royalty-free through LNL; contact the

CC surrounding several markers of the invention. The markers were	
CC identified using the series of primer pairs given in T71901-72	
CC which were used to determine the presence or absence of the common	
CC hereditary haemochromatosis (HH) gene mutation in an individual. The	
CC method comprised assessing genomic DNA from an individual for the	
CC presence or absence of the HH-associated allele of the single base-pair	
CC polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optional	
CC marker comprising the following microsatellite repeat alleles of group	
CC A and optionally of group B:	
CC Group A: 19D9, 18B4, 1A2, 1E4, 24E2, 2B8, 321-1, 4073-1, 4440-1, 4440-2,	
CC 731-1, 5091-1, 3216-1, 4072-2, 950-1, 950-2, 950-3, 950-5, 950-6,	
CC 950-8, 63-1, 63-2, 63-3, 65-1, 65-2, 373-8, 373-29, 68-1, 241-6, 241-29;	
CC Group B: D6S464, D6S306, D6S258, D6S265, D6S105 and D6S1001.	
CC The absence of the genotype indicates the likelihood of the presence of	
CC the HH mutation. Knowledge of the new genetic markers allows the	
CC definition of genotypes characteristic of heterozygous carriers and	
CC homozygotes having a HH mutation in their genomic DNA. The potential for	
CC HH in an individual interferes with the effectiveness of interferon	
CC treatment for hepatitis C infection. By diagnosing this potential, the	
CC responsiveness of interferon treatment may be evaluated.

 DR Modified hepatitis B virus large surface protein - has amino acid  
 PT sequence encoding L protein used in vaccine for treating or  
 PT preventing hepatitis B without effects  
 PS Disclosure: Page 4-7: 79pp: English.  
 CC The modified protein comprises amino acids 12-52 (amino acid 13 is  
 CC opt. deleted), followed by 133-145, then 175-400 of the wild-type  
 CC sequence.  
 CC This protein is devoid of the following properties: to function  
 CC as a substrate to yeast glycosylation enzymes, polymerised human  
 CC serum albumin binding capacity and protease sensitivity.  
 CC The modified product may be used alone or in a composite particle  
 CC comprising at least two polypeptides corresp. to all or part of a  
 CC protein having the biological activity of one of the hepatitis  
 CC B surface antigens. The composite particles are useful for  
 CC preparing improved hepatitis B vaccines or for treating of HBV.

 DR Identifying gene signatures in 3'-directed human cDNA library - e.g.  
 PT for diagnosis of abnormal cell function, by preparing cDNA that  
 PT reflects relative abundance of corresp. mRNA in specific human  
 PT tissues  
 PS Claim 1: Page 2152-2153: 2245pp: Japanese.  
 CC A single-stranded DNA (or its complementary strand or the corresp.

CC double-stranded DNA) which comprises one of the 7837 "GS" sequences  
 CC given in T19001-T26837 and which is able to hybridise to part of  
 CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)  
 CC sequences were obtained from 3'-directed cDNA libraries prepared  
 CC from various human tissues; synthesis of cDNA was initiated from the  
 CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-  
 CC untranslated sequence is unique to a particular mRNA species, almost  
 CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library  
 CC is constructed so as to reflect accurately the relative abundance of  
 CC different mRNAs in the particular tissue from which it was derived.  
 CC The appearance frequency of a given GS in a cDNA library can be  
 CC determined (esp. using primers and probes derived from the GS  
 CC sequences) as a means of diagnosing abnormal cell function or for  
 CC recognising different cell types.

 PS Claim 1: Page 2979: 3271pp: English.  
 CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences  
 CC of the invention. The DNA sequences are recorded on a computer readable  
 CC medium, preferably selected from a floppy or hard disk, random access  
 CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using  
 CC the S.aureus DNA sequences allows putative functions to be assigned so  
 CC that protein-encoding or regulatory regions of commercial, therapeutic or  
 CC industrial importance can be obtained. Specifically, sequences which are  
 CC likely to encode antigens have been identified and these polypeptides can  
 CC be used in a vaccine composition against S.aureus infection. The  
 CC polypeptides can also be used in a kit for the immunodetection of  
 CC S.aureus in a sample. S.aureus is implicated in numerous human diseases,  
 CC including cellulitis, eyelid infections, food poisoning, osteomyelitis,  
 CC skin and surgical wound infections, scalded skin syndrome, toxic shock  
 CC syndrome, etc. Organisms transformed with the DNA sequences can be used  
 CC for recombinant production of the polypeptides. The new DNA sequences  
 CC (and their fragments) are useful as primers or probes for isolating  
 CC homologues of any of the S.aureus DNA sequences contained on the  
 CC computer readable medium.

PR Genes and their products differentially expressed in T helper cells
PT - useful in diagnosis and treatment of immune disorders, e.g.
PS multiple sclerosis, asthma, lepromatous leprosy, etc.
PS Claim 1; Fig 24; 218pp; English.
CC Novel human gene 200 (T38267) was isolated from a lambda gt11
CC human lymphocyte cDNA library using the murine 200 gene (see also
CC T38265) as probe. The gene codes for a novel cell surface
CC receptor (W01049) of the Ig superfamily class. The 200 gene is
CC expressed at levels many-fold higher in T helper TH1 cell
CC subpopulations than in TH2 cell subpopulations. The gene and its
CC product can be used therapeutically to ameliorate immune disorders
CC and in the diagnosis of such disorders. It can also be used to
CC produce soluble 200 gene-Ig fusions and to breed transgenic animals
CC useful as models of TH cell subpopulation-related disorders.

PR Patched protein other than Drosophila melanogaster patched protein -
PT used for characterising the phenotype of a tumour
PS Claim 5; Pages 63-66; 86pp; English.
CC This genomic DNA encodes a mouse patched (ptc) protein. This can be used
CC to construct an expression cassette comprising an altered patch or
CC hedgehog gene. The expression cassette comprises a nucleic acid encoding
CC a patched protein other than a Drosophila melanogaster patched protein,
CC or fragment of at least 12 nucleotides in length, as other than an intact
CC chromosome under transcriptional control of a transcriptional initiation
CC region, and a transcriptional termination region, both functional in an
CC expression host. A genetically engineered mammalian cell comprising this
CC expression cassette as an extrachromosomal element or integrated into the
CC genome of the cell can be predisposed to develop basal cell carcinoma as
CC a result of the transfection. By analysing DNA, functional analysis of
CC patched protein function, or by detecting antibody binding to abnormal
CC patched protein, a genetic predisposition to developmental abnormalities
CC and cancer can be diagnosed. This analysis can also be used for
CC characterising the phenotype of a tumour, particularly a carcinoma,
```

```
CC especially a basal cell carcinoma. The methods can also be used for
CC characterising transitional cell carcinoma of the bladder, meningiomas
CC medulloblastomas, etc. The modified cells comprising the expression
CC cassette can be used to determine the role of different exons of the
CC patched gene in oncogenesis, signal transduction, etc. Transgenic animal
CC models created from these cells can be used as animal models for
CC carcinomas of the skin. The patched protein of mosquito, butterfly or
CC beetle or alternatively, a mammalian patched protein of human or mouse
CC can be used to identify ligands or substrates that bind to, modulate, or
CC mimic the action of patched gene. These agents could be used as tumour
CC suppressors, cell adhesion promoters (e.g. in wound healing and ageing).

PR Patched protein other than Drosophila melanogaster patched protein -
PT used for characterising the phenotype of a tumour
PS Claim 2; Pages 49-51; 86pp; English.
CC This DNA is stated to encode a Precis coenia patched (ptc) protein and
CC is identical to the mouse ptc cDNA. This can be used to construct an
CC expression cassette comprising an altered patch or hedgehog gene. The
CC expression cassette comprises a nucleic acid encoding a patched protein
CC other than a Drosophila melanogaster patched protein, or fragment of at
CC least 12 nucleotides in length, as other than an intact chromosome under
CC transcriptional control of a transcriptional initiation region, and a
CC transcriptional termination region, both functional in an expression
CC host. A genetically engineered mammalian cell comprising this expression
CC cassette as an extrachromosomal element or integrated into the genome of
CC the cell can be predisposed to develop basal cell carcinoma as a result
CC of the transfection. By analysing DNA, functional analysis of patched
CC protein function, or by detecting antibody binding to abnormal patched
CC protein, a genetic predisposition to developmental abnormalities and
CC cancer can be diagnosed. This analysis can also be used for
CC characterising the phenotype of a tumour, particularly a carcinoma,
CC especially a basal cell carcinoma. The methods can also be used for
CC characterising transitional cell carcinoma of the bladder, meningiomas
CC medulloblastomas, etc. The modified cells comprising the expression
CC cassette can be used to determine the role of different exons of the
CC patched gene in oncogenesis, signal transduction, etc. Transgenic animal
CC models created from these cells can be used as animal models for
CC carcinomas of the skin. The patched protein of mosquito, butterfly or
CC beetle or alternatively, a mammalian patched protein of human or mouse
CC can be used to identify ligands or substrates that bind to, modulate, or
CC mimic the action of patched gene. These agents could be used as tumour
CC suppressors, cell adhesion promoters (e.g. in wound healing and ageing).

PT Nucleic acid encoding vertebrate patched protein and related  
PT transformants - used to express poly:peptide(s), useful for  
PT diagnosis and treatment of developmental disorders or cancer, and in  
PT healing of injured tissue  
PS Claim 1; Column 43-48; 38pp; English.  
CC The present sequence represents the mouse patched (ptc) gene. Cells  
CC containing and expressing the ptc gene are used for the recombinant  
CC production of the protein. These in turn are useful: (1) for generating  
CC antibodies (Ab); and (11) to screen for specific-binding ligands  
CC (potential therapeutic agonists and antagonists). The ptc gene, or its  
CC fragments, are used to isolate related sequences from other mammals; to  
CC identify mutations (particularly those associated with genetic diseases  
CC such as spina bifida and other developmental disorders); to monitor  
CC expression levels in testis (to determine relationship with sperm  
CC production) and to isolate 5'-non-coding sequences (used to study  
CC embryonic development and to provide regulated expression of proteins).  
CC The complete gene can be used in gene therapy, including expression of  
CC antisense molecules, and to generate transgenic animals for studies of  
CC embryonic development. Ab are used diagnostically to determine the  
CC ptc protein on cell surfaces and as competitive inhibitors of signal  
CC transduction through the ptc ligand. Cells that have been engineered to  
CC express the ptc protein can be used to promote regrowth and healing of  
CC damaged tissue (e.g. growth of new teeth) and regulation of the ptc  
CC protein expression may be useful in cancer treatment (it may control the  
CC Wnt-1 oncogene).

 PT New polynucleotides encoding human secreted proteins - derived from  
 PT e.g. human blood, kidney, foetal lung, placenta, testes, brain,  
 PT ovary, pituitary, retina and colon cDNA libraries  
 PS Claim 1; Page 229; 641pp; English.  
 CC The present sequence represents an expressed sequence tag (EST), and is  
 CC a polynucleotide of the invention. The polynucleotides of the invention  
 CC are all secreted EST sequences isolated from a variety of human tissue  
 CC sources. The EST sequences and proteins encoded by them are predicted to  
 CC have useful biological activities which would make them suitable for  
 CC treating, preventing or ameliorating medical conditions in humans and  
 CC animals, although no supporting data is given. Suggested activities  
 CC include nutritional activity, immune stimulating or suppressing activity,  
 CC haematopoiesis regulating activity, tissue growth activity,  
 CC activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic  
 CC and thrombolytic activity, receptor/ligand activity, anti-inflammatory  
 CC activity, cadherin/tumour invasion suppressor activity, tumour inhibition  
 CC activity. The EST sequences are also stated to be useful for gene  
 CC therapy.

 PT Viral vector derived from ovine adenovirus (OAV287) - used for  
 PT recombinant prodn. and delivery of non-adenoviral polypeptide(s) or  
 PT RNA molecules in host animals, esp. sheep.  
 PS Claim 1; Fig 1; 53pp; English.  
 CC The sequence represents the entire genome of ovine adenovirus OAV287,  
 CC a benign adenovirus isolated from sheep in Australia, and begins at  
 CC base 1 of the left-hand inverted terminal repeat. The sequence has  
 CC been determined by cloning BamHI restriction fragments representing  
 CC the entire genome and sequencing nested deletion mutants. Reading  
 CC frames have been tentatively identified, including E1A/B, E4 and E3.  
 CC The sequence contains promoters, inverted terminal repeats, viral  
 CC packaging signals and RNA processing signals. The entire genomic  
 CC clone is present in plasmid pOAV100. It is possible to introduce  
 CC recombinant DNA at non-essential sites, e.g. in the E3 region,  
 CC including a rotavirus VP/SC antigen, Trichostrogylus colubriformis  
 CC I7-kDa antigen, Teenia ovis 45w antigen or Lucilia cuprina PM95  
 CC antigen gene, or DNA encoding antisense RNA or a ribozyme. The  
 CC sequence may be used in construction of vectors to express  
 CC heterologous DNA in a grazing animal, e.g. a sheep. Many host  
 CC species have no pre-existing immunity to the virus, allowing  
 CC efficient infection, gene delivery and expression, and the  
 CC possibility of virus spread to a non-target host is minimized. The  
 CC virus may be used as a vector for recombinant vaccine production or  
 CC transgenic animal construction.

PT New isolated prostate-derived nucleic acids - used to develop

PT products which may have cytokine, immune regulatory, haematopoiesis

PT regulating, anti-inflammatory or tumour inhibition activity

CC Claim 1: Page 327-328; 67pp; English.

CC X40438 to X40715 represent 5' expressed sequence tags (ESTs) for human

CC secreted proteins expressed in prostate, and encode the proteins given in

CC Y11716 to Y11993 respectively. The proteins given represent the signal

CC peptide and an N-terminal fragment of a secreted protein. The nucleic

CC acid sequences can be used for producing secreted human gene products.

CC They can also be used to develop products for diagnosis and therapy. The

CC proteins obtained may have cytokine activity, cell proliferation and

CC differentiation activity, haematopoiesis regulating activity, tissue

CC growth regulating activity, reproductive hormone regulating activity,

CC chemotactic/chemokinetic activity, haemostatic and thrombolytic activity,

CC receptor/ligand activity, anti-inflammatory activity, tumour inhibition

CC activity or other activities. The products can be used in forensic, gene

CC therapy and chromosome mapping procedures. The sequences can also be used

CC for obtaining corresponding promoter sequences. The nucleic acids

CC encoding the signal peptides can be used for directing extracellular

CC secretion of a polypeptide or the insertion of a polypeptide into a

CC membrane, or importing a polypeptide into a cell.

PT New nucleic acid encoding the human translocation promoter Bonzo -  
PT used to screen for potential agents for treating acquired immune  
PT deficiency syndrome.  
PS Disclosure, page 81-82; 97pp; English.  
CC This cDNA clone codes for pig-tailed macaque Bonzo (see W97785), a  
CC novel HIV/SIV translocation promoting agent that acts in conjunction  
CC with CD4 to serve as a receptor for the entry into a cell of a virus  
CC having a specific viral envelope glycoprotein. Bonzo is a member of  
CC the 7-transmembrane G-protein coupled receptor family, is closely  
CC related to the chemokine receptor family, and is expressed in  
CC lymphoid tissues. The invention provides the amino acid sequences  
CC (see W97783-88) and DNA sequences (see X07289-94) of human,  
CC African green monkey and pig-tailed macaque Bonzo and Bob (brother  
CC of Bonzo) translocation promoting agents. These novel receptors  
CC were identified using an expression cloning strategy. They were  
CC found to be used by particular strains of HIV-2 and M-tropic HIV-1.  
CC The invention also includes: mammalian cells transfected with Bonzo  
CC and/or Bob and human CD4, which can be used to screen potential  
CC therapeutic agents and identify ligands; antibodies to Bonzo, which  
CC can be used therapeutically, e.g. as antagonists or to target  
CC toxins or radioisotopes to HIV-permissive cells; transgenic  
CC animals; and antisense and ribozyme molecules, which may also be  
CC used therapeutically, particularly expressed from a gene therapy  
CC vector.

PT Polynucleotide(s) and proteins derived from Staphylococcus aureus -  
PT stored on computer readable medium and used in the production of  
PT anti-S.aureus vaccines.  
PS Claim 1; Page 2433; 3271pp; English.  
CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences  
CC of the invention. The DNA sequences are recorded on a computer readable  
CC medium, preferably selected from a floppy or hard disk, random access  
CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using  
CC the S.aureus DNA sequences allows putative functions to be assigned so  
CC that protein-encoding or regulatory regions of commercial, therapeutic or  
CC industrial importance can be obtained. Specifically, sequences which are  
CC likely to encode antigens have been identified and these polypeptides can  
CC be used in a vaccine composition against S.aureus infection. The  
CC polypeptides can also be used in a kit for the immunodetection of  
CC S.aureus in a sample. S.aureus is implicated in numerous human diseases,  
CC including cellulitis, eyelid infections, food poisoning, osteomyelitis,  
CC skin and surgical wound infections, scalded skin syndrome, toxic shock  
CC syndrome, etc. Organisms transformed with the DNA sequences can be used  
CC for recombinant production of the polypeptides. The new DNA sequences  
CC (and their fragments) are useful as primers or probes for isolating  
CC homologues of any of the S.aureus DNA sequences contained on the  
CC computer readable medium.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

E. coli transposon insertion: The present data does not contain E.
colli transposon sequences which integrated in the
original/previous sequences. We determined the boundary between
the insertion and genomic sequences experimentally. removed the
insertion sequences, reconstituted the present data. The sequencing
project is supported by Japan Science Technology Corporation (JST)
and The Institute of Physical and Chemical Research (RIKEN).

## Sequence Quality Assessment:

This entry has been annotated with sequence quality estimates computed by the Phrap assembly program. All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp. Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN.1 file.

Double stranded (DS) coverage: 76.6%  
DS or two chemistry coverage: 99.9%  
Single stranded regions: 2

## Sequence Validation:

This sequence has been validated by Multiple Complete Digest Mapping. Comparison of the experimentally derived map digest fragments with sequence-predicted fragments is given below. Small fragments below a variable cutoff (approximately 400-600bp) are not mapped and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragment groups are separated by dashed lines.

COMMENT  
\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 17 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as

\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

FT      /*tag= d
PT      /note= "Non-essential region suitable for cloning"
PN      WO9603508-A1.
PD      08-FEB-1996.
PF      26-JUL-1995: AU0453.
PR      26-JUL-1994: AU-007101.
PA      (CSTR ) COMMONWEALTH SCI & IND RES ORG.
PI      Both GW, Boyle DB, Vriati S;
DR      WPI: 96-117053/12.
PT      Viral vector derived from ovine adenovirus (OAV287) - used for
PT      recombinant prodn. and delivery of non-adenoviral polypeptide(s) or
PS      RNA molecules in host animals, esp. sheep.
CC      Claim 1: Fig 1: 53pp: English.
CC      The sequence represents the entire genome of ovine adenovirus OAV287,
CC      a benign adenovirus isolated from sheep in Australia, and begins at
CC      base 1 of the left-hand inverted terminal repeat. The sequence has
CC      been determined by cloning BamHI restriction fragments representing
CC      the entire genome and sequencing nested deletion mutants. Reading
CC      frames have been tentatively identified, including ELA/B, E4 and E3.
CC      The sequence contains promoters, inverted terminal repeats, viral
CC      packaging signals and RNA processing signals. The entire genomic
CC      clone is present in plasmid pOAV100. It is possible to introduce
CC      recombinant DNA at non-essential sites, e.g. in the E3 region,
CC      including a rotavirus VP3C antigen, Trichostyrnylus colubiformis
CC      17-kDa antigen, Terebia ovis 45W antigen or Lucilia cuprina p95
CC      antigen gene, or DNA encoding antisense RNA or a ribozyme. The
CC      sequence may be used in construction of vectors to express
CC      heterologous DNA in a grazing animal, e.g. a sheep. Many host
CC      species have no pre-existing immunity to the virus, allowing
CC      efficient infection, gene delivery and expression, and the
CC      possibility of virus spread to a non-target host is minimized. The
CC      virus may be used as a vector for recombinant vaccine production or
CC      transgenic animal construction.

PT      Major surface glyco-protein of Pneumocystis carinii, encoded by
PT      multi-copy gene family - used in a vaccine and diagnostic assay
PT      for P. carinii infection in AIDS patients
PS      Disclosure; Page 36; 50pp: English.
CC      Multiple clones were identified by immunoscreening a rat P. carinii
CC      cDNA library using rat serum generated against whole rat P. carinii.
CC      Clones reactive with polyclonal serum were evaluated to identify
CC      those encoding gp116. Three such clones (PC3, PC5 and PC14) were

```

```

CC      sequenced and contained ORFs encoding closely related but distinct
CC      proteins. Although none of the clones contained the complete
CC      coding sequence, overlapping regions allowed alignment of the three
CC      clones and generation of a putative composite sequence encoding a
CC      protein of ca. 122 kD. The gp116 of P. carinii can be used in a
CC      vaccine against infection in HIV-infected individuals and also as a
CC      diagnostic agent. Study of the expression of the protein should lead
CC      to understanding its role in the pathogenesis of P. carinii pneumonia
CC      and may lead to new strategies for control or prevention of infection.
CC      The DNA sequence may be used to make PCR primers for diagnostic use.

PT Isolated Enterococcus faecalis polynucleotides and polypeptides  
PT - used to develop products for the detection of Enterococcus and for  
PT use in vaccines for prevention or attenuation of Enterococcus  
PT infection.  
PT Claim 1; Page 739-755; 2084pp. English.  
CS A computer readable medium has been developed which has recorded on it  
CS 962 nucleotide sequences isolated from the Enterococcus faecalis genome.  
CC X12938 to X13919 represent these nucleotide sequences which are primary  
CC nucleotide sequences, also known as contigs. The computer-based system  
CC can identify fragments of the Enterococcus faecalis genome with  
CC commercial importance. The products can be used to detect the presence  
CC of Enterococcus faecalis in samples. They can also be used for  
CC diagnosing Enterococcal infection in an animal and monitoring  
CC progression of disease, and for identifying agents which can be used to  
CC modulate the growth or pathogenicity of Enterococcus faecalis, or  
CC another related organism, in vivo or in vitro. In particular the  
CC polypeptides encoded by the Enterococcus faecalis nucleotide sequences  
CC can be used in vaccines to prevent or attenuate an Enterococcal  
CC infection.

PT      Haemophilus somnus immunogenic proteins used in vaccines -
PT      selected from haemin-binding protein, haemolysin, Lppb and Lppc,
PT      and corresp. DNA
PS      Claim 8; Fig 2; 119pp: English.
CC      A genomic cosmid library of Haemophilus somnus HS25 DNA was screened
CC      for clones capable of binding bovine haemin and having haemolytic
CC      activity. Positive clones were subcloned various times, resulting
CC      in plasmid pRA501, which binds haemin but is not haemolytic. The
CC      clone was sequenced and was found to contain several open reading
CC      frames, potentially encoding 8 proteins. The haemin binding protein
CC      (encoded by the hmb gene) was encoded by ORF1. The protein can be
CC      used in vaccines for preventing or treating H. somnus infections,
CC      which cause thromboembolic meningo-encephalitis, septicemia,
CC      arthritis and pneumonia in vertebrates.

PT      Diagnosis of pre-disposition to brain tumours - using DNA
PT      encoding nestin which distinguishes neural multi-potential stem
PT      cells from neuronal, glial and muscle cells
PS      Claim 3; Fig 1; 63pp: English.
CC      A lambda gt11 cDNA expression library was constructed from poly(A)+
CC      RNA from CNS of day 15 rat embryos. The library was screened with
CC      Mab Rat 401. cDNA from the most immunopositive clone was used as
CC      a probe to isolate additional clones from a lambda gt10 library
CC      from rat E15 CNS. Hybridising clones were sequenced; the remainder
CC      of the nestin gene was obtained from genomic sequences. There are
CC      two potential initiation codons at positions 128 and 160. Sequence
CC      comparison of cDNA and genomic clones reveals three introns at
CC      positions 912, 1038 and 1111. The sequence has significant
CC      similarities to the five classes of intermediate filaments.
CC      The coding sequence can be used to develop probes for
CC      detecting predisposition to brain tumours; the expression of nestin
CC      distinguishes neural multi potential stem cells and brain tumour
CC      cells from the more differentiated neural cell types (e.g. neuronal,

PT Nucleic acid primers and probes for detecting HIV 1 and HIV 2 -  
PT using known nucleic acid amplification procedures especially  
PT oligonucleotide hybridisation PCR  
PS Disclosure: Page 27-28; 35pp; English.  
CC The invention provides primer/probe sets for detecting HIV-1 or HIV-2  
CC that comprise two primers and at least one probe. The primer/probe sets  
CC are useful to detect HIV (i.e. HIV-1 and HIV-2, either separately or  
CC simultaneously) in biological samples using known nucleic acid  
CC amplification procedures e.g. PCR, reverse transcriptase (RT) PCR and  
CC especially oligonucleotide hybridisation PCR (OH PCR); HIV-1 and HIV-2  
CC are different viruses each with several subtypes due to the highly  
CC mutable nature of the virus (attributed to the inefficiency with which  
CC it converts its genetic material (RNA) into DNA to allow it to insert its  
CC genetic information into the host and/or recombination of viral genomes  
CC from different HIV populations). The sequences are designed to detect all  
CC known HIV-1 or HIV-2 subtypes by OH PCR and allow detection of target  
CC sequences which are DNA or, sequences which are embedded within the HIV  
CC genome and are therefore RNA by RT-PCR. Sequences X05232 to X05233  
CC represent specifically claimed primer and probe sequences present in  
CC eight different primer/probe sets that are used for detecting HIV-1 and  
CC HIV-2. The present sequence represents HIV-1 genomic DNA sequence that  
CC can be used as a target sequence in the method of the invention.

PT Mouse full length or truncated beta-3 integrin sub-unit(s) and  
PT coding sequences - useful for screening for cpds. that inhibit bone  
PT resorption  
PS Claim 5: Fig 1A-1D; 30pp; English.  
CC A cDNA clone (T61290) codes for the full-length mouse vitronectin  
CC integrin receptor beta-3 subunit (W13573). It was isolated from a  
CC mouse osteoclast cDNA library. Clones were obtd. by screening the  
CC library with a probe obtd. using primers (see also T61292-93) based  
CC on a highly conserved sequence amongst all integrin beta subunits,  
CC and the 3' cDNA of the clone was obtd. by PCR (see also T61294-95).  
CC A cDNA clone (T61291) for a novel truncated, soluble beta-3  
CC integrin (W13574) was also isolated. These cDNA clones can be used  
CC to produce (truncated) beta-3 integrin in host cells for use in  
CC assays to identify novel cpds. which bind the integrin, esp. for  
CC inhibiting bone resorption e.g. in osteoporosis.

PT	ligandin composition	
PS	Claim 14; Page 48-51; 71pp: English.	
CS	This genomic DNA sequence includes a coding region, interrupted	
CC	by 2 introns, that codes for the ferulate-5-hydroxylase (F5H, see	
CC	M40099) of Arabidopsis thaliana. It comprises the HindIII-XhoI	
CC	fragment of pBIC20-F5H genomic clone isolated from a pBIC50	
CC	cosmid library using F5H cDNA (see V10237) as probe. F5H is a	
CC	cytochrome P450-dependent monooxygenase that catalyses the	
CC	meta-hydroxylation of ferulic acid in the monomer-specific pathway	
CC	branch required for sinapic acid and syringyl lignin biosynthesis.	
CC	A tissue-specific regulatory plant promoter, preferably derived	
CC	from the regulatory region of the C4H gene (see V10236) can be	
CC	linked to the F5H gene in order to increase the syringyl content of	
CC	ligandin in a transformed plant such as alfalfa, rice, maize, oilseed	
CC	rape, forage grasses, eucalyptus, pine, spruce, poplar, Arabidopsis	
CC	and tobacco. Increased levels of syringyl monomer residues in	
CC	ligandin renders the polymer more readily delignified so that the	
CC	plant is more readily pulped or digested.

PT Nucleic acid encoding plant ferulate-5-hydroxylase - useful for  
PT altering guaiacyl:syringyl lignin monomer ratio in plants, to  
PT increase chemical delignification in paper and pulp making or to  
PT increase digestibility of feedstocks  
PS Claim 2; Page 29-31; 43pp; English.  
CC This genomic DNA sequence includes exons that encode the ferulate-  
CC 5-hydroxylase (F5H) (see W26640) of Arabidopsis thaliana. It  
CC comprises a HindIII-XhoI fragment of genomic clone pBIC20-F5H,  
CC which was isolated from a genomic library generated in binary  
CC cosmid vector pBIC20 by screening with a F5H cDNA insert (see  
CC T90504). A claimed chimeric gene that causes an altered  
CC guaiacyl:syringyl lignin monomer ratio in a transformed plant  
CC comprises the F5H cDNA or genomic clone linked either in the sense  
CC or antisense direction to at least one regulatory sequence. The  
CC gene allows the alteration of a plant's lignin content, especially  
CC to increase the syringyl lignin content. This renders the lignin  
CC more susceptible to chemical delignification of use to the paper  
CC and pulp industries. Alteration of the lignin content of grasses  
CC increases the digestibility for animal feedstocks. Suitable host  
CC plants include alfalfa, rice, maize, oilseed rape, forage grasses,  
CC tobacco, and tree crops such as eucalyptus, pine, spruce and poplar.

PT New nucleic acids encoding human secreted - proteins obtained from
PT cDNA libraries prepared from substantia nigra, cerebellum, surrenals
PT and fetal brain tissue
PS Claim 1; Page 175; 434pp; English.
CC X39440 to X39597 represent 5' expressed sequence tags (ESTs) for human
CC secreted proteins, and encode the proteins given in Y1374 to Y1531,
CC respectively. The proteins given represent the signal peptide and an
CC N-terminal fragment of a secreted protein. The nucleic acid sequences
CC can be used for producing secreted human gene products. They can also
CC be used to develop products for diagnosis and therapy. The proteins
CC obtained may have cytokine activity, cell proliferation/differentiation
CC activity, haematopoiesis regulating activity, tissue growth regulating
CC activity, reproductive hormone regulating activity, chemotactic/
CC chemokinetic activity, haemostatic and thrombolytic activity, receptor/
CC ligand activity, anti-inflammatory activity, tumour inhibition activity
CC or other activities. The products can be used in forensic, gene therapy
CC and chromosome mapping procedures. The sequences can also be used for
CC obtaining corresponding promoter sequences. The nucleic acids encoding
CC the signal peptide can be used for directing extracellular secretion of
CC a polypeptide or the insertion of a polypeptide into a membrane, or
CC importing a polypeptide into a cell.

P-PSDB: R91594.  
PT DNA encoding an interleukin-15 receptor - used to ameliorate undesired  
PT effects of interleukin-15, e.g. to prevent or treat graft rejection  
PS Claim 1; Page 23-34; 53pp; English.  
CC The cDNA shows a human open reading frame (ORF) encoding interleukin-15  
CC receptor (IL-15R) (see R91594), isolated from clone W5. It was isolated  
CC by cross-species hybridisation with the murine IL-15R cDNA (R15757). The  
CC mammalian IL-15R is encoded by a multi-exon gene. IL-15R variants can be  
CC attributed to different mRNA splicing events following transcription or  
CC from proteolytic cleavage of the IL-15R protein, where the IL-15R binding  
CC property is retained. The IL-15R protein is useful in treatment of  
CC undesired effects of interleukin-15, e.g. to prevent or treat graft  
CC rejection.

PT Genes involved in viral infection and tumour suppression - used to  
PT develop products for reducing or preventing viral infection or for  
PT suppressing tumours  
PS Claim 1; Page 73; 101pp; English.  
CC The present sequence represents a viral infection gene. The present  
CC invention describes nucleic acid sequences isolated from rat. The  
CC sequences of the invention comprise 70 viral infection (VI) genes and  
CC 8 tumour suppressor (TS) genes. Propagating cell cultures in the  
CC absence of the serum protein (SP) allows selective elimination of cells  
CC persistently infected with a virus from the cell culture. Inhibitors of  
CC the SP can be used for reducing or inhibiting a viral infection.  
CC Inhibitors of the TS gene products can be used to suppress a malignant  
CC phenotype (MP). The methods and inhibitors can be used with viruses  
CC such as HIV, influenza, hepatitis virus or animal retroviruses such as  
CC simian immunodeficiency virus, avian immunodeficiency virus, bovine  
CC immunodeficiency virus, feline immunodeficiency virus, equine infectious  
CC anemia virus, canine arthritis encephalitis virus or vena virus.  
CC Because the identified genes are non-essential to cell survival, the  
CC treatment methods can be used in subjects without serious detrimental  
CC effects to the subjects.

PT	Diagnosing and genotyping of hereditary haemochromatosis (HH) -						
PT	using primers to detect specific polymorphisms of the HH gene on						
PT	chromosome 6p2.1 or novel microsatellite markers						
PS	Disclosure: Fig 1Y; 67pp; English.						
CC	The sequences given in T43925-55 represent portions of the genome						
CC	surrounding several markers of the invention. The markers were						
CC	identified using the series of primer pairs given in T71901-72						
CC	which were used to determine the presence or absence of the common						
CC	hereditary haemochromatosis (HH) gene mutation in an individual. The						
CC	method comprised assessing genomic DNA from an individual for the						
CC	presence or absence of the HH-associated allele of the single base-pair						
CC	polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optimal						
CC	marker comprising the following microsatellite repeat alleles of group						
CC	A and optionally of group B:						
CC	Group A: 19D9, 18B4, 1A2, 1E4, 2A2E, 2B8, 3321-1, 4073-1, 4440-1, 4440-2,						
CC	731-1, 5091-1, 3216-1, 4072-2, 950-1, 950-2, 950-3, 950-4, 950-5, 950-6,						
CC	950-8, 63-3, 63-2, 63-3, 65-1, 65-2, 373-8, 373-29, 66-1, 241-6, 241-29;						
CC	Group B: D6S464, D6S306, D6S258, D6S265, D6S105 and D6S1001.						
CC	The absence of the genotype indicates the likelihood of the presence of						
CC	the HH mutation. Knowledge of the new genetic markers allows the						
CC	definition of genotypes characteristic of heterozygous carriers and						
CC	homozygotes having a HH mutation in their genomic DNA. The potential for						
CC	HH in an individual interferes with the effectiveness of interferon						
CC	treatment for hepatitis C infection. By diagnosing this potential, the						
CC	responsiveness of interferon treatment may be evaluated.

 PT Polynucleotide(s) and proteins derived from Staphylococcus aureus  
 stored on computer readable medium and used in the production of  
 PT anti-S.aureus vaccines  
 PS Claim 1: Page 2979; 3271pp; English.  
 CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences  
 of the invention. The DNA sequences are recorded on a computer readable  
 CC medium, preferably selected from a floppy or hard disk, random access  
 CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using  
 CC the S.aureus DNA sequences allows putative functions to be assigned so  
 CC that protein-encoding or regulatory regions of commercial, therapeutic or  
 CC industrial importance can be obtained. Specifically, sequences which are  
 CC likely to encode antigens have been identified and these polypeptides can  
 CC be used in a vaccine composition against S.aureus infection. The  
 CC polypeptides can also be used in a kit for the immunodetection of  
 CC S.aureus in a sample. S.aureus is implicated in numerous human diseases,  
 CC including cellulitis, eyelid infections, food poisoning, osteomyelitis,  
 CC skin and surgical wound infections, scalded skin syndrome, toxic shock  
 CC syndrome, etc. Organisms transformed with the DNA sequences can be used  
 CC for recombinant production of the polypeptides. The new DNA sequences  
 CC (and their fragments) are useful as primers or probes for isolating  
 CC homologues of any of the S.aureus DNA sequences contained on the  
 CC computer readable medium.

 PT Identifying gene signatures in 3'-directed human cDNA library - e.g.  
 PT for diagnosis of abnormal cell function, by preparing cDNA that  
 PT reflects relative abundance of corresp. mRNA in specific human  
 PT tissues  
 PS Claim 1: Page 978; 2245pp; Japanese.  
 CC A single-stranded DNA (or its complementary strand or the corresp.  
 CC double-stranded DNA) which comprises one of the 7837 "GS" sequences  
 CC given in T19001-T26837 and which is able to hybridise to part of  
 CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)  
 CC sequences were obtained from 3'-directed cDNA libraries prepared  
 CC from various human tissues; synthesis of cDNA was initiated from the  
 CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-  
 CC untranslated sequence is unique to a particular mRNA species, almost  
 CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library  
 CC is constructed so as to reflect accurately the relative abundance of  
 CC different mRNAs in the particular tissue from which it was derived.  
 CC The appearance frequency of a given GS in a cDNA library can be  
 CC determined (esp. using primers and probes derived from the GS  
 CC sequences) as a means of diagnosing abnormal cell function or for  
 CC recognising different cell types.

 PT Genes and their products differentially expressed in T helper cells  
 PT - useful in diagnosis and treatment of immune disorders, e.g.  
 PT multiple sclerosis, asthma, lepromatous leprosy, etc.  
 PS Claim 1: Fig 24; 218pp; English.  
 CC Novel human gene 200 (T38267) was isolated from a lambda gtl1  
 CC human lymphocyte cDNA library using the murine 200 gene (see also  
 CC T38265) as probe. The gene codes for a novel cell surface  
 CC receptor (W01049) of the Ig superfamily class. The 200 gene is  
 CC expressed at levels many-fold higher in T helper Th1 cell  
 CC subpopulations than in Th2 cell subpopulations. The gene and its  
 CC product can be used therapeutically to ameliorate immune disorders  
 CC and in the diagnosis of such disorders. It can also be used to  
 CC produce soluble 200 gene-Ig fusions and to breed transgenic animals  
 CC useful as models of TH cell subpopulation-related disorders.

 PT Patched protein other than Drosophila melanogaster patched protein -  
 PT used for characterising the phenotype of a tumour

PS Claim 5: Pages 63-66: 86pp: English.  
 CC This genomic DNA encodes a mouse patched (ptc) protein. This can be used  
 CC to construct an expression cassette comprising an altered patch or  
 CC hedgehog gene. The expression cassette comprises a nucleic acid encoding  
 CC a patched protein other than a Drosophila melanogaster patched protein,  
 CC or fragment of at least 12 nucleotides in length, as other than an intact  
 CC chromosome under transcriptional control of a transcriptional initiation  
 CC region, and a transcriptional termination region, both functional in an  
 CC expression host. A genetically engineered mammalian cell comprising this  
 CC expression cassette as an extrachromosomal element or integrated into the  
 CC genome of the cell can be predisposed to develop basal cell carcinoma as  
 CC a result of the transfection. By analysing DNA, functional analysis of  
 CC patched protein function, or by detecting antibody binding to abnormal  
 CC patched protein, a genetic predisposition to developmental abnormalities  
 CC and cancer can be diagnosed. This analysis can also be used for  
 CC characterising the phenotype of a tumour, particularly a carcinoma,  
 CC especially a basal cell carcinoma. The methods can also be used for  
 CC characterising transitional cell carcinoma of the bladder, meningiomas  
 CC medulloblastomas, etc. The modified cells comprising the expression  
 CC cassette can be used to determine the role of different exons of the  
 CC patched gene in oncogenesis, signal transduction, etc. Transgenic animal  
 CC models created from these cells can be used as animal models for  
 CC carcinomas of the skin. The patched protein of mosquito, butterfly or  
 CC beetle or alternatively, a mammalian patched protein of human or mouse  
 CC can be used to identify ligands or substrates that bind to, modulate, or  
 CC mimic the action of patched gene. These agents could be used as tumour  
 CC suppressors, cell adhesion promoters (e.g. in wound healing and ageing).

 DR Patched protein other than Drosophila melanogaster patched protein -  
 PT used for characterising the phenotype of a tumour  
 PS Claim 2: Pages 49-51: 86pp: English.  
 CC This DNA is stated to encode a Precis coenia patched (ptc) protein and  
 CC is identical to the mouse ptc cDNA. This can be used to construct an  
 CC expression cassette comprising an altered patch or hedgehog gene. The  
 CC expression cassette comprises a nucleic acid encoding a patched protein  
 CC least 12 nucleotides in length, as other than an intact chromosome under  
 CC transcriptional control of a transcriptional initiation region, and a  
 CC transcriptional termination region, both functional in an expression  
 CC host. A genetically engineered mammalian cell comprising this expression  
 CC cassette as an extrachromosomal element or integrated into the genome of  
 CC the cell can be predisposed to develop basal cell carcinoma as a result  
 CC of the transfection. By analysing DNA, functional analysis of patched  
 CC protein function, or by detecting antibody binding to abnormal patched  
 CC protein, a genetic predisposition to developmental abnormalities and

CC cancer can be diagnosed. This analysis can also be used for  
 CC characterising the phenotype of a tumour, particularly a carcinoma,  
 CC especially a basal cell carcinoma. The methods can also be used for  
 CC characterising transitional cell carcinoma of the bladder, meningiomas  
 CC medulloblastomas, etc. The modified cells comprising the expression  
 CC cassette can be used to determine the role of different exons of the  
 CC patched gene in oncogenesis, signal transduction, etc. Transgenic animal  
 CC models created from these cells can be used as animal models for  
 CC carcinomas of the skin. The patched protein of mosquito, butterfly or  
 CC beetle or alternatively, a mammalian patched protein of human or mouse  
 CC can be used to identify ligands or substrates that bind to, modulate, or  
 CC mimic the action of patched gene. These agents could be used as tumour  
 CC suppressors, cell adhesion promoters (e.g. in wound healing and ageing).

 PT Nucleic acid encoding vertebrate patched protein and related  
 PT transformants - used to express poly-peptide(s), useful for  
 PT diagnosis and treatment of developmental disorders or cancer, and in  
 PT healing of injured tissue  
 PS Claim 1: Column 43-48; 38pp: English.  
 CC The present sequence represents the mouse patched (ptc) gene. Cells  
 CC containing and expressing the ptc gene are useful: (i) for generating  
 CC production of the protein. These in turn are useful: (i) for generating  
 CC antibodies (Ab); and (ii) to screen for specific-binding ligands  
 CC (potential therapeutic agonists and antagonists). The ptc gene, or its  
 CC fragments, are used to isolate related sequences from other mammals; to  
 CC identify mutations (particularly those associated with genetic diseases  
 CC such as spina bifida and other developmental disorders); to monitor  
 CC expression levels in testis (to determine relationship with sperm  
 CC production) and to isolate 5' non-coding sequences (used to study  
 CC embryonic development and to provide regulated expression of proteins).  
 CC The complete gene can be used in gene therapy, including expression of  
 CC antisense molecules, and to generate transgenic animals for studies of  
 CC embryonic development. Ab are used diagnostically to determine the  
 CC ptc protein on cell surfaces and as competitive inhibitors of signal  
 CC transduction through the ptc ligand. Cells that have been engineered to  
 CC express the ptc protein can be used to promote regrowth and healing of  
 CC damaged tissue (e.g. growth of new teeth) and regulation of the ptc  
 CC protein expression may be useful in cancer treatment (it may control the  
 CC Wnt-1 oncogene).

PT Nucleic acid encoding vertebrate patched protein and related  
PT transforms - used to express poly(peptide(s), useful for  
PT diagnosis and treatment of developmental disorders or cancer, and in  
PT healing of injured tissue  
PS Example: Column 21-26; 38BP; English.  
CC The present invention describes vertebrate and invertebrate patched (ptc)  
CC genes. Cells containing and expressing the ptc gene are used for the  
CC recombinant production of the protein. These in turn are useful: (1) for  
CC generating antibodies (Ab); and (11) to screen for specific-binding  
CC ligands (potential therapeutic agonists and antagonists). The ptc gene,  
CC or its fragments, are used to isolate related sequences from other  
CC mammals; to identify mutations (particularly those associated with  
CC genetic diseases such as spina bifida and other developmental disorders);  
CC to monitor expression levels in testis (to determine relationship with  
CC sperm production) and to isolate 5'-non-coding sequences (used to study  
CC embryonic development and to provide regulated expression of proteins).  
CC The complete gene can be used in gene therapy, including expression of  
CC antisense molecules, and to generate transgenic animals for studies of  
CC embryonic development. Ab are used diagnostically to determine the  
CC ptc protein on cell surfaces and as competitive inhibitors of signal  
CC transduction through the ptc ligand. Cells that have been engineered to  
CC express the ptc protein can be used to promote regrowth and healing of  
CC damaged tissue (e.g. growth of new teeth) and regulation of the ptc  
CC protein expression may be useful in cancer treatment (it may control the  
CC Wnt-1 oncogene). The present sequence represents Precis coenla  
CC (butterfly) patched gene, from the present invention.

PT New polynucleotides encoding human secreted proteins - derived from  
PT e.g. human blood, kidney, foetal lung, placenta, testes, brain,  
PT ovary, pituitary, retina and colon cDNA libraries  
PS Claim 1; Page 229; 641BP; English.  
CC The present sequence represents an expressed sequence tag (EST), and is  
CC a polynucleotide of the invention. The polynucleotides of the invention  
CC are all secreted EST sequences isolated from a variety of human tissue  
CC sources. The EST sequences and proteins encoded by them are predicted to  
CC have useful biological activities which would make them suitable for  
CC treating, preventing or ameliorating medical conditions in humans and  
CC animals, although no supporting data is given. Suggested activities  
CC include nutritional activity, immune stimulating or suppressing activity,  
CC haematopoiesis regulating activity, tissue growth activity,  
CC activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic  
CC and thrombolytic activity, receptor/ligand activity, anti-inflammatory  
CC activity, cadherin/tumour invasion suppressor activity, tumour inhibition  
CC activity. The EST sequences are also stated to be useful for gene  
CC therapy

PT New nucleic acids encoding human secreted proteins - obtained from  
PT cDNA libraries prepared from e.g. liver, ovary, brain, prostate,  
PT kidney, lung, umbilical cord, placenta and colon tissue  
PS Claim 1; Page 188-189; 824BP; English.  
CC X41094 to X41347 represent 5' expressed sequence tags (ESTs) for human  
CC secreted proteins, and encode the proteins given in Y12261 to Y12514,  
CC respectively. The proteins given represent the signal peptide and an  
CC N-terminal fragment of a secreted protein. The nucleic acid sequences  
CC can be used for producing secreted human gene products. They can also

CC be used to develop products for diagnosis and therapy. The proteins  
 CC obtained may have cytokine activity, cell proliferation/differentiation  
 CC activity, hematopoiesis regulating activity, tissue growth regulating  
 CC activity, reproductive hormone regulating activity, chemotactic/  
 CC chemokinetic activity, haemostatic and thrombolytic activity, receptor/  
 CC ligand activity, anti-inflammatory activity, tumour inhibition activity  
 CC or other activities. The products can be used in forensic, gene therapy  
 CC and chromosome mapping procedures. The sequences can also be used for  
 CC obtaining corresponding promoter sequences. The nucleic acids encoding  
 CC the signal peptide can be used for directing extracellular secretion of  
 CC a polypeptide or the insertion of a polypeptide into a membrane, or  
 CC importing a polypeptide into a cell.

irradiation with 1400 Gys. 1st strand cDNA was primed with a Not I - oligo(dT) primer  
 5'GTGATGACATCTGTGAAGGGAGAGCGCCGCTTTTTTTTTTTTTTTTTTT  
 T3'] double-stranded cDNA was ligated to Eco RI  
 adaptors [AATTCGATCCTGG], digested with Not I and cloned  
 into the Not I and Eco RI sites of the modified pT73  
 vector. Library constructed by Bob Barstead. "

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT New polynucleotides encoding human secreted proteins - derived from  
PT e.g. human blood, kidney, foetal lung, placenta, testes, brain,  
PT ovary, pituitary, retina and colon CDNA libraries.  
PS Claim 1: Page 459; 618pp; English.  
CC The present sequence represents a human expressed sequence tag (EST).  
CC The polynucleotide, which is a secreted EST, and the encoded protein  
CC are predicted to have useful biological activities which would make  
CC them suitable for treating, preventing or ameliorating medical  
CC conditions in humans and animals, although no supporting data is  
CC given. Suggested activities include nutritional activity, immune  
CC stimulating or suppressing activity, haematopoiesis regulating  
CC activity, tissue growth activity, activin/inhibin activity,  
CC chemotactic/chemokinetic activity, haemostatic and thrombolytic  
CC activity, receptor/ligand activity, anti-inflammatory activity,  
CC cadherin/tumour invasion suppressor activity, tumour inhibition  
CC activity. The polynucleotide may also be useful for gene therapy.

PT Chimeric human interferon-gamma receptor/immunoglobulin proteins  
PT - used to inhibit binding of interferon-gamma to its specific  
PT receptor in the treatment of illnesses  
PS Disclosure: Figure 1; 29pp; English.  
CC The soluble form of the interferon (IFN) gamma receptor comprises  
CC the whole extracellular domain of the natural receptor from the N-  
CC terminus to the transmembrane region, lacks the cytoplasmic and  
CC transmembrane domains of the natural receptor and specifically binds  
CC IFN-gamma. The sequence encoding the soluble IFN-gamma receptor can  
CC be used in constructs encoding chimeric proteins where the other  
CC component of the chimeric protein is part or all of the constant  
CC domain of a human immunoglobulin heavy or light chain. The  
CC recombinant proteins can be used to inhibit IFN-gamma binding to its  
CC specific receptor. They can be used for the treatment of  
CC illnesses, especially autoimmune diseases, chronic inflammation,  
CC delayed type hypersensitivity, allotransplant rejections, multiple  
CC sclerosis, fulminant hepatitis, inflammatory neurological diseases  
CC and neurological complications of AIDS, poliovirus infections, Lyme  
CC disease and septicemia. The presence of the immunoglobulin  
CC component in the chimeric protein increases the proteins half life in  
CC vivo.

 PT Nucleic acid corresponding to human genes implicated in  
 branchio-oto-renal syndrome - useful for, e.g. diagnosis and  
 treatment of syndrome and possibly some carcinogenic processes,  
 PT particularly in kidneys  
 PS Claim 1, Page 44-105; 191pp: English.  
 CC The present sequence represents a portion of the human eya-1 gene.  
 CC Alterations in the eyal gene are associated with branchio-oto-renal  
 CC (BOR) syndrome, including the form (BO) without renal anomalies, and  
 CC possibly in some carcinogenic processes, particularly in the kidney.  
 CC The related genes eya-2 and eya-3 may also be involved in development  
 CC of tumours and cell differentiation. Antibodies specific for EYA  
 CC proteins are used to detect the proteins by immunassay, while genetic  
 CC alterations linked to BOR are detected by amplifying DNA with primers  
 CC (see V52857 to V52893) then identifying any mutations or deletions. EYA1  
 CC and EYA1-B proteins, corresponding nucleic acid, antisense sequences and  
 CC Ab can be used therapeutically to modulate expression of EYA1(B), or  
 CC their active derivatives, especially for treating renal disease  
 CC associated with eyal abnormalities, also for ensuring correct  
 CC development of grafted organs, especially where these are embryonic.  
 CC Therapeutic proteins are administered to maintain 0.1-10 mu g /ml in  
 CC body fluids, locally or systemically. Nucleic acid is administered in  
 CC usual gene therapy vectors (optionally to cells ex vivo) at doses of  
 CC 0.1-100 mu g.

 PT New isolated human genes and polypeptides used in, e.g. treatment of  
 PT gastrointestinal ulceration  
 PS Claim 2: Fig 53: 320pp; English.  
 CC X52213-74 encode secreted and transmembrane human proteins, and are  
 CC obtained from cDNA libraries, prepared from fetal lung, fetal kidney,  
 CC fetal brain, fetal liver and fetal retina. The encoded polypeptides  
 CC have specific uses based on their homology to known polypeptides,  
 CC e.g. PRO211 and PRO217 can be used for disorders associated with the  
 CC preservation and maintenance of gastrointestinal mucosa and the repair  
 CC of acute and chronic mucosal lesions (e.g. enterocolitis,  
 CC Zollinger-Ellison syndrome, gastrointestinal ulceration and congenital  
 CC microvillus atrophy), skin diseases associated with abnormal keratinocyte  
 CC differentiation (e.g. psoriasis, epithelial cancers such as lung squamous  
 CC cell carcinoma of the vulva and gliomas), potent effects on cell growth  
 CC and development, diseases related to growth or survival of nerve cells  
 CC including Parkinson's disease, Alzheimer's disease, ALS, neuropathies or  
 CC cancer. PRO265 can be used as for fibromodulin, e.g. for reducing dermal  
 CC scarring. PRO264 can be used as a target for anti-tumor drugs. PRO533  
 CC may be used in the treatment of Usher Syndrome or Atrophia areata;  
 CC PRO269 can be used as an anti-thrombotic agent; PRO287 polypeptides  
 CC and portions may have therapeutic applications in wound healing and  
 CC tissue repair; PRO317 can be used for treating problems of the kidney,  
 CC uterus, endometrium, blood vessels, or related tissue, e.g. in the  
 CC heart of genital tract.

CC The vector encodes soluble or membrane-bound Fc-gamma-RIII, which can be  
CC used to treat immune thrombocytopenic purpura. Cells transformed with  
CC the vector, and carrying the protein on the cell surface can be used for  
CC detecting immune complexes in a sample.

 PT New human transcription factor E2f-2 - involved in cell cycle  
 regulation and useful for drug screening, also related cDNA,  
 PT plasmids and transformed cells.  
 PS Example 1; Page 15; 53pp; English.  
 CC 086484-91 correspond to the E2f-1 primers e20-27 and f120  
 CC respectively. The amplified E2f-1 DNA binding region is  
 CC substantially complementary to the E2f-2 coding region and is  
 CC used as a probe for this region. E2f-2 is involved in cell cycle  
 CC regulation. In particular binding of E2f to the retinoblastoma  
 CC gene product (pRb) causes down regulation of the transcription  
 CC of genes containing the E2f binding site. E2f-2 is useful in  
 CC the study of cell cycle regulation especially in the study  
 CC of pRb and certain viral oncogenes and oncoproteins.

 PT Mutant lenti-virus Env protein principal immuno-dominant domains -  
 PT can produce neutralising antibodies to protect against e.g. FIV or  
 PT HIV, but do not produce facilitating antibodies  
 PS Claim 6: Page 21; 38pp; French.  
 CC The present sequence encodes a specifically claimed example of a novel  
 CC peptide fragment which is a mutant of the wild-type (w.t.) principal  
 CC immunodominant domain (PID) of feline immunodeficiency virus such  
 CC that an Env protein containing the fragment retains the ability to  
 CC produce neutralising antibodies (Abs) but does not produce  
 CC facilitating or deleterious Abs against the w.t. PID. The mutated  
 CC Env protein can be used for producing vaccines against FIV. In  
 CC addition to vaccination, the peptide fragment is useful as a  
 CC diagnostic reagent, specifically to distinguish between Abs produced  
 CC in response to vaccination and those resulting from viral infection.  
 CC Also, the results of anti-FIV vaccination can be monitored  
 CC using the peptide.

 PT Melanoma-associated chondroitin sulphate proteoglycan - useful for  
 PT prophylaxis or treatment of melanoma-associated tumours  
 PS Claim 6: Page 31-48; 88pp; English.  
 CC A cDNA clone (T60450) codes for melanoma-associated chondroitin  
 CC sulphate proteoglycan (MCSP) (W15566). The complete coding

CC sequence and 3' untranslated region were obt'd. by sequencing small  
 CC overlapping cDNA clones produced by PCR amplification (see also  
 CC T60451-83), and by analysis of cDNA clone lambda M3.1 obt'd.  
 CC from a melanoma cDNA library. MCSP cDNA, esp. sequences excluding  
 CC nucleotides 4867-7898 or 4858-5357, can be used to produce  
 CC recombinant MCSP in host cells for use in vaccines and in methods  
 CC for the treatment and diagnosis of melanoma, sarcoma and  
 CC glioblastoma. Probes (T60462-67) derived from MCSP cDNA can be  
 CC used to identify novel non-human homologues of MCSP and in tumour  
 CC diagnosis, e.g. to localise MCSP mRNA in primary melanomas or  
 CC metastatic lesions.

COMMENT  
On Jun 3, 1999 this sequence version replaced gi:4938320.  
IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments. Unfinished: dJ503F13 Contig\_ID: 02079 acc=AL050337 Length: 1642 bp Unfinished: dJ503F13 Contig\_ID: 01588 acc=AL050337 Length: 51717 bp Unfinished: dJ503F13 Contig\_ID: 01205 acc=AL050337 Length: 62239 bp.  
\* NOTE: This is a 'working draft' sequence.  
\* This record will be updated with the finished sequence as soon as it is available and the accession number will \* be preserved.

 PT Recombinant DNA encoding Rickettsia surface layer proteins - useful  
 PT for diagnosing typhus and spotted fever and for preparing vaccines  
 PT against them  
 PS Claim 1: Column 11-24; 20pp: English.  
 CC This sequence encodes the Surface layer (S-layer) protein from  
 CC R. prowazekii strain Breinl. This sequence is useful for vaccination  
 CC against typhus and spotted fever rickettsial infection or for diagnosing  
 CC diseases caused by these bacteria. The surface layer protein antigens can  
 CC be produced recombinantly in large quantities

 PT New isolated human XAG growth factor(s) - used to develop products  
 PT for treating e.g. liver, lung or breast diseases or  
 PT hyperproliferative disorders, e.g. cancer.  
 PS Claim 5: Fig 2A-B; 14pp: English.  
 CC This cDNA clone codes for huxag-2 (see W37845), a member of a novel  
 CC family of human growth factors also including huxag-1 (see W37844)  
 CC and huxag-3 (see W37846). These proteins share homology with the  
 CC XAG protein of *Xenopus laevis*, which is involved in embryogenesis  
 CC and is expressed in adult tissue. huxag-2 cDNA was isolated from a  
 CC cDNA library derived from human microvascular endothelial cells.  
 CC Vectors, host cells, antibodies, and screening methods for agonists  
 CC and antagonists of huxag-2 are provided. huxag polypeptides are  
 CC growth factors and can be used to stimulate proliferation of cells.  
 CC They can be used to stimulate the proliferation and differentiation  
 CC of hepatocytes to alleviate or treat liver diseases and pathologies  
 CC such as fulminant liver failure caused by cirrhosis, liver damage  
 CC caused by viral hepatitis and toxic substances. They can also be  
 CC used to stimulate or promote liver regeneration, e.g. after

CC surgery. They can also be used to prevent and heal damage to the  
 CC lungs caused by various pathological states. They can be used to  
 CC stimulate proliferation and differentiation and promote the repair  
 CC of alveoli and broncholar epithelium to prevent, attenuate, or  
 CC treat acute or chronic lung damage, e.g. emphysema, which results  
 CC in the progressive loss of alveoli, and inhalation injuries, e.g.  
 CC resulting from smoke inhalation and burns, that cause necrosis of  
 CC the broncholar epithelium and alveoli. They can also be used to  
 CC stimulate the proliferation and differentiation of breast tissue  
 CC and could therefore be used to promote healing of breast tissue  
 CC injury due to surgery, trauma or cancer. Antagonists can be used  
 CC to treat hyperproliferative disorders, including cancer, in  
 CC particular hepatocellular carcinoma, osteosarcoma, breast cancer,  
 CC or colon cancer. The products can also be used for detection and  
 CC diagnosis.

 PT New isolated human secreted protein, SSP-1 - used to develop  
 PT products for treating hyperproliferative or hypoproliferative  
 PT disorders, e.g. cancers and fibroproliferative disorders  
 PS Claim 15: Fig 1; 13pp: English.  
 CC This is the nucleotide sequence encoding the human small secreted  
 CC protein-1 (SSP-1) involved in the method of the invention to develop  
 CC products for hyperproliferative or hypoproliferative disorders.  
 CC Based on the fact that SSP-1 is a secreted protein having a small  
 CC molecular size, SSP-1 is likely to be a cellular communication  
 CC factor, such as a cytokine. It is likely to regulate cell  
 CC proliferation, differentiation and/or survival. Alternatively,  
 CC SSP-1 could also interact with an extracellular molecule, e.g. a

CC protein, and be involved in the transport of such molecule, or  
CC : SSP-1 can be a structural protein. The SSP-1 compounds can be used  
CC for modulating growth, differentiation or survival of cells. SSP-1  
CC can be used for treating or preventing a disease associated with an  
CC abnormal cell proliferation, differentiation or survival in a subject,  
CC such as a hyperproliferative or hypoproliferative disease, e.g.  
CC cancers.

CC dysfunction, such as cancer, post-herpetic neuralgia, diabetic  
CC neuropathy, osteoarthritis, Alzheimer's or Parkinson's diseases, Kuru,  
CC psychosis and schizophrenia. Probes based on the DNA are used to detect  
CC the DNA in usual hybridisation or amplification tests, while monoclonal  
CC antibodies are used to detect the protein for diagnosis (in vitro or by  
CC in situ immuno-fluorescent assay). Compared with wild-type alpha7 nACHR,  
CC the protein has about 100-fold greater sensitivity to cholinergic  
CC receptor agonists (nicotine or acetylcholine) and response to these  
CC agonists decays more slowly, but the wild-type inward rectification is  
CC retained.

PT Vectors containing accessory molecule ligand genes - used for  
PT altering immunoreactivity of cells, particularly for treatment of  
PT neoplasia or autoimmune disorders, e.g. rheumatoid arthritis  
PS Disclosure: Page 117; 167pp; English.  
CC The present sequence represents a CD40 ligand gene. The sequence is  
CC used to exemplify the method of the invention. The specification  
CC describes a method for altering the immunoreactivity of human cells  
CC which comprises introducing a gene encoding an accessory molecule  
CC ligand (AML) into the cells so that the AML is expressed on the surface  
CC of the cells. Vectors containing the AML genes can be used in gene  
CC therapy for treating neoplasia or autoimmune disorders such as rheumatoid  
CC arthritis. They can also be used for vaccination to produce immunity  
CC against a virus cell, bacteria, protein, fungus or neoplasia.

PT Nucleic acid encoding trichosanthin protein - which can be used  
PT to inactivate ribosome(s) to inhibit protein synthesis or to  
PT inhibit HIV expression  
PS Example 6; Fig 11; 53pp; English.

CC A synthetic alpha-cricriochosanthin gene was constructed to facilitate  
CC mutational analysis of alpha-TCS in experiments to investigate  
CC structure-function relationships. The synthetic gene contains  
CC unique restriction sites spaced 20-90bp apart. The translation  
CC product of the synthetic gene corresponds to the mature alpha-TCS.  
CC Variants of the protein can be generated by mutagenesis of the  
CC synthetic gene. The variants can then be screened for changes in  
CC ribosome inhibitory and/or HIV-1 inhibitory activities.  
CC See Q26499-Q26505.

PT Deoxyribonucleic acid isolates coding for enkephalinase - and prodyn  
PT of enkephalinase, used in therapeutic applications in diagnostic  
PT immunoassay and as immunosuppressants.

The DNA was sequenced from clones isolated from a lambda gt10 library constructed from poly(A<sup>+</sup>) human placental RNA. At posn. 1413 one clone, lambdaDN7 was observed to have a G (coding for Ala.) in clone lambdaDN5 this was found to be an A (Thr). Since the former is identical to the rat amino acid at posn. 465, the latter probably represents an error of the reverse transcriptase synthesis of the mRNA. The DNA can be ligated into an expression vector for prodn. of the enkephalinase protein in a host. The recombinant protein is useful in the treatment of various pathological disorders associated with endogenous peptides such as tachykinins and kinins, eg. acute inflammation, and hyperimmune responses. It is also useful in diagnostic immunoassays, and as immunosuppressants by virtue of their ability to digest chemotactic molecules. This sequence is also published in Ep-279929.

 PT Method for assay of enkephalinase using dansylated peptide(s) -  
 PT for identification of recombinant enkephalinase  
 PS disclosure; Fig 1; 61pp; English.  
 CC This sequence encodes human enkephalinase.  
 CC This sequence encodes human enkephalinase. Enkephalinase is a  
 CC neutral endopeptidase or kidney brush border neutral proteinase.  
 CC has been isolated from the kidney, intestine, pituitary, brain and  
 CC lymph nodes, and has been detected in many peripheral organs and  
 CC human neutrophils. The distribution of enkephalinase in the brain  
 CC closely parallels the distribution of the enkephalins. Mammalian  
 CC enkephalinase may be used in the treatment of various pathological  
 CC disorders associated with various endogenous peptides, eg.  
 CC tachykinins and kinins.

Streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000 (especially 10-300)  $\mu\text{g/ml}$  per dose.

 PS Claim 1; Page 131-132; 181pp; English.  
 QC The sequence is that of a Streptococcal polypeptide coding region.  
 CC The polypeptide can potentially be used for the diagnosis and  
 CC prevention of bacterial infections, especially SP infection.  
 CC It may be used for the treatment of diseases such as otitis media,  
 CC conjunctivitis, pneumonia, bacteraemia, meningitis, sinusitis, pleural  
 CC empyema, endocarditis or infection of the cerebrospinal fluid.  
 QD Sequence 1660 BP; 469 A; 392 C; 323 G; 476 T;

CC The present invention describes a computer readable medium which has  
CC the nucleotide sequences SEQ ID NO:1 to 391 (VS2134 to VS2524) recorded  
CC on it, or a representative fragment or a sequence at least 95% identical  
CC to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1  
CC to 391 (VS2134 to VS2524) are genomic fragments from *Streptococcus*  
CC pneumoniae. The present invention also describes an isolated nucleic acid  
CC molecule encoding a homologue of any of the fragments of the *S. pneumoniae*  
CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced  
CC by a process comprising: (a) screening a genomic DNA library using as a  
CC probe a target sequence defined by any of the sequences in SEQ ID NO:1  
CC to 391, identifying members of the library which contain sequences  
CC that hybridise to the target sequence and isolating the nucleic acid  
CC molecules from the members; or (b) isolating mRNA, DNA or cDNA produced  
CC from an organism, amplifying nucleic acid molecules whose nucleotide  
CC sequence is homologous to amplification primers derived from the  
CC fragment of the *S. pneumoniae* genome to prime the amplification and  
CC isolating the amplified sequences. The computer readable medium can be  
CC used in a computer-based system for identifying fragments of the  
CC *S. pneumoniae* genome of commercial importance, or expression modulating  
CC fragments of the *S. pneumoniae* genome. Products from the present  
CC invention can be used in diagnosis kits and assays, and pharmaceutical  
CC compositions and vaccines for *S. pneumoniae*.

PT Method for the detection of bacterial species using probes and

PT primers - allows detection and quantification of antibiotic

PS resistant bacteria in patients, the environment and food

PS Claim 52; Page 88; 216pp; English.

CC The sequences given in T28527/32 represent probes which were used in

CC the method of the invention for the detection of S. pneumoniae in a

CC sample. The method comprises using probes and/or amplification primers

CC which are specific, ubiquitous and sensitive for determining the presence

CC and/or amount of nucleic acids from selected bacterial species in any

CC sample, where the bacterial nucleic acid comprises a selected target

CC region hybridisable with the probes or primers. The method comprises

CC contacting the sample with the probes or primers. The method comprises

CC the presence and/or amount of hybridised primers or amplification products

CC as and indication of the presence and/or amount of the bacterial

CC species. This method may be used to detect commonly encountered

CC bacterial pathogens, e.g. Escherichia coli, Klebsiella pneumoniae,

CC Pseudomonas aeruginosa, Proteus mirabilis, Streptococcus pneumoniae,

CC Staphylococcus aureus, Staphylococcus epidermidis, Enterococcus

CC faecalis, Staphylococcus saprophyticus, Streptococcus pyogenes,

CC Haemophilus influenzae and Moraxella catarrhalis. These bacterial

CC species are associated with approx. 90% of urinary tract infections and

CC with a high percentage of other severe infections including

CC septicemia, meningitis, pneumonia, intra-abdominal infections, skin

CC infections and other severe respiratory tract infections. The method

CC may also be used to evaluate a bacterial resistance to beta-lactam

CC antibiotics.

PT New isolated Enterococcus faecalis polynucleotides and polypeptides  
PT - used to develop products for the detection of Enterococcus and for  
PT use in vaccines for prevention or attenuation of Enterococcus  
PT infection.

PS Claim 1; Page 626-631; 2084pp; English.

CC A computer readable medium has been developed which has recorded on it  
CC 982 nucleotide sequences isolated from the Enterococcus faecalis genome.  
CC X12938 to X13191 represent these nucleotide sequences which are primary  
CC nucleotide sequences, also known as contigs. The computer-based system  
CC can identify fragments of the Enterococcus faecalis genome with  
CC commercial importance. The products can be used to detect the presence  
CC of Enterococcus faecalis in samples. They can also be used for  
CC diagnosing Enterococcal infection in an animal and monitoring  
CC progression of disease, and for identifying agents which can be used to  
CC modulate the growth or pathogenicity of Enterococcus faecalis, or  
CC another related organism, in vivo or in vitro. In particular the  
CC polypeptides encoded by the Enterococcus faecalis nucleotide sequences  
CC can be used in vaccines to prevent or attenuate an Enterococcal  
CC infection.

CC cultured and implanted under the renal capsule of mice.  
CC Reconstructions were harvested 5 weeks later. When they showed  
CC signs of distress from the tumour burden. Metastasised tumours were  
CC isolated from a site outside the renal capsule. RNA was isolated  
CC from primary tumours and metastases, reverse transcribed and  
CC subjected to differential display PCR. The sequences were analysed  
CC to obtain metastatic sequences, e.g. the present sequence. The  
CC method can be used to detect, diagnose and treat disorders related  
CC to metastasis, or treat malignant or non-malignant disorders, e.g.  
CC hyperplasia, dysplasia and hypertrophy. The metastatic sequence can  
CC be used to screen a biological sample for metastasis, and it or its  
CC expression product may also be used to treat a metastatic disorder.

PT Kidney injury-associated molecule, KIM, polypeptides - upregulated  
PT in injured or regenerating tissues, useful to promote tissue growth

PT and regeneration, especially to treat renal conditions  
PS Claim 9; Page 70-71; 213pp; English.  
CC The present sequence represents a kidney injury associated molecule  
CC (KIM) cDNA clone. KIM proteins can be administered therapeutically  
CC by expressing KIM encoding polynucleotides, to promote growth and/or  
CC survival of damaged tissue (e.g. renal tissue), since the KIM proteins  
CC are upregulated in injured or regenerating (especially renal) tissues.  
CC KIM fusion proteins, conjugates, antibodies and vectors can also be used  
CC therapeutically, e.g. these or the KIM proteins may be included with an  
CC acceptable carrier in pharmaceutical compositions, useful for therapy/  
CC prophylaxis of conditions associated with dysfunction/dysregulation of  
CC KIM genes or proteins, especially renal diseases or impairments of renal  
CC function in humans (e.g. acute renal failure, acute nephritis). The  
CC polynucleotides can be used to produce antisense sequences which, when  
CC internalised into cells, can disrupt expression of a cellular KIM gene,  
CC also useful in therapy (e.g. to block the growth of tumours dependent on  
CC KIM for growth) or compositions. The proteins and polynucleotides are  
CC useful diagnostically e.g. to detect and quantify renal injury/disease  
CC (indicative of increased risk, or presence of, renal injury or impaired  
CC function), or abnormal responses to tissue injury (indicative of  
CC increased risk, or presence of, an autoimmune response or abnormal  
CC tissue growth arising from/affecting renal tissue). The proteins can  
CC also be used to locate KIM-producing cells (especially specific loci,  
CC e.g. tissue masses abnormally producing/expressing KIM such as tumours  
CC arising from/affecting renal tissue), by contacting cells with an  
CC imageable KIM-binding reagent and imaging reagent accumulation.

 PT Recombinant nucleic acid contg. modified tospovirus sequence - used to prepare plants resistant or tolerant to tospovirus  
 PS Claim 1; Page 14-16; 38pp; English.  
 CC A DNA sequence (T38305) is complementary to one which encodes the tomato spotted wilt virus M-RNA sequence which itself encodes the putative viral movement protein. A recombinant nucleic acid contains a transcriptional regulatory region and, under its control, the tospovirus sequence, pref. modified by removal or inactivation of the start codon, and insertion or deletion of the nucleotides 3' of the start codon to alter the reading frame of the encoded RNA. A plant having such a construct stably integrated and expressed in its genome is resistant to, or tolerant of, tospoviruses.

 PT Vaccine against liver fluke infection in ruminants, esp. sheep -  
 PT comprises glutathione-S-transferase extracted from adult fasciola hepatica worms.  
 PS Claim 9; Fig 15; 44pp; English.  
 CC A cDNA library was constructed from total RNA of adult worms of the Compton strain of Fasciola hepatica in either lambda gtl1 or lambda ZAP phage vectors. The library was screened with rabbit antiserum raised to purified GSTs of F.hepatica. Clone GST-7 was isolated from a lambda ZAP library and was used to isolate other homologous sequences. It contains a poly(A) tail indicating the 3' end of mRNA has been cloned. The protein derived from this sequence begins 7 amino acids from the N-terminus of GST(Fh2a) and is homologous to it.  
 CC This sequence can be used in a vaccine for preventative treatment of liver fluke in ruminants.

 PT Natriuretic protein receptor B - for diagnosis and treatment of  
 PT Kidney failure, heart failure, hyperaldosteronism, glaucoma etc.  
 PS Claim 3; Fig 1; 49p; English.  
 CC The sequence encodes natriuretic peptide receptor B, NPRB, having  
 CC guanyl cyclase (GC) activity and protein kinase activity. The DNA  
 CC can be inserted into expression vectors for the prodn. of the  
 CC protein, opt. after being mutated to produce NPRB analogues. The  
 CC sequence can also be used to screen for mRNA encoding NPRB for  
 CC diagnostic purposes. The protein itself (or variants) can be used  
 CC in treatment of natriuretic peptide disorders, and also to isolate  
 CC peptides using affinity chromatography. Antibodies with affinity  
 CC for NPRB can also be prepd.

PT      Transgenic animals defective in one type of opiod receptor - used
PT      to identify agents for treatment of pain, drug addiction and
PT      transplant rejection, lacking side effects of known opiate(s)
PS      Disclosure: Fig 12; 58pp; French.
CC      This sequence represents the gene encoding the mouse delta opiate
CC      receptor protein. The sequence is used to generate a transgenic
CC      non-human mammal for identifying agents for treating disorders
CC      associated with opiate receptors. In the mammal, the expression of
CC      the gene encoding the opiate receptor is modified, particularly by
CC      the deletion of an exon and/or insertion of a marker gene, e.g. the
CC      neomycin resistance gene, into the sequence. Especially the expression
CC      of the gene is altered in nervous tissue. The agents are potentially
CC      useful for treating severe pain (chronic or acute), drug addiction and/or
CC      prevention or treatment of transplant rejection (as immunosuppressants).
CC      The method may isolate and identify powerful analgesics that lack
CC      morphine-like side effects.

PT      New isolated EH domain binding proteins and peptide(s) - obtained
PT      using signal transducers eps15 and eps15R containing EH domains by
PT      detecting specific binding activity.
PS      Claim 4; Page 54-56; 90pp; English.
CC      The present invention describes a new intracellular interactor and novel
CC      protein:protein interaction (EH) domain binding protein having (parts of)
CC      one of the following human derived sequences designated: (i) h-NUMB;
CC      (ii) h-NUMB-R; (iii) h-RAB-R; (iv) ehb3; (v) ehb10; or (vi) ehb21. The
CC      present invention also describes peptides containing at least one NPF
CC      (Asp-Pro-Phe) motif, able to bind to a protein with at least one EH
CC      domain. The proteins with a NPF-containing peptide or the peptides
CC      themselves can be used to identify and purify EH containing proteins.
CC      Antisense RNA, complementary to mRNA encoding h-NUMB, h-NUMB-R, h-RAB-R,
CC      ehb3, ehb10, or ehb21, can be used for diagnostic and therapeutic uses.
CC      Products from the present invention can also be used to develop agents
CC      for use in control of cell proliferation. The present sequence encodes
CC      human ehb21.

PT      Nucleic acid encoding human aminopeptidase P
PS      Claim 13; Page 139-165; 201pp; English.
CC      This invention describes the isolation of a novel human aminopeptidase P
CC      (Amp). This protein is used to produce recombinant Amp and can be used
CC      for gene therapy for treating Amp-deficiency conditions. Its fragments
CC      are used as primers and probes to identify patients with homozygous and
CC      heterozygous Amp deficiency, including prenatal diagnosis (patients
CC      defective in Amp are at risk of developing angioedema if treated with
CC      angiotensin-converting enzyme inhibitors), also as antisense inhibitors
CC      in cases of excessive Amp expression. The product of the invention is
CC      also used to identify Amp-expressing sequences in other animals and to
CC      generate transgenic animals, and comparisons of genomic sequences are
CC      used to detect mutations. Amp inhibitors are potentially useful as

PT Polynucleotides and peptides derived from opioid receptor
PT polypeptides - for use in therapeutic compositions and in
PT screening assays for useful drug substances.
PS Claim 6: Page 215-221. 300pp. English.
CC The nucleotide sequence of the novel mouse delta opioid receptor gene
CC MORL1. The gene was isolated from a mouse brain cDNA library using a
CC fragment (amplified from the cDNA library with primers Q75929-30) as a
CC probe. The primers are based on the conserved sequences present in the
CC second and third transmembrane domains of somatostatin (SRIF) receptor
CC subtypes SSTR1, SSTR2 and SSTR3. The 1.3 kb EcoRI-SacI fragment from the
CC mouse delta opioid receptor clone, lambda msl-2, was subcloned into the
CC CMV promoter-based expression vector pCMV-6c. The resultant construct
CC pCMV-msl-2 was transfected into COS-1 cells for protein production. The
CC gene encoding the opioid receptor can be used to produce complete,
CC truncated or chimeric opioid receptor proteins. The opioid receptors
CC thus produced are useful for the development of novel assays designed to
CC select or improve substances, capable of interacting with the opioid
CC receptor proteins, for use in diagnosis, drug design and therapeutic
CC applications.

PT Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT for diagnosis of abnormal cell function, by preparing cDNA that
PT reflects relative abundance of corresp. mRNA in specific human
PT tissues.
PS Claim 1: Page 996. 2245pp. Japanese.
CC A single-stranded DNA (or its complementary strand or the corresp.
CC double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC given in 119001-126837 and which is able to hybridise to part of
CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC sequences were obtained from 3'-directed cDNA libraries prepared
CC from various human tissues; synthesis of cDNA was initiated from the

```

```

CC 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC untranslated sequence is unique to a particular mRNA species, almost
CC all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC is constructed so as to reflect accurately the relative abundance of
CC different mRNAs in the particular tissue from which it was derived.
CC The appearance frequency of a given GS in a cDNA library can be
CC determined (esp. using primers and probes derived from the GS
CC sequences) as a means of diagnosing abnormal cell function or for
CC recognising different cell types.

PT	Purified DNA mol. for diagnosis of porcine malignant hyperthermia		
PT	- compliss DNA sequence encoding normal or mutant ryanodine		
PT	receptor with specified endonuclease restriction map		
PS	Disclosure; Fig 2: 96pp; English.		
CC	The sequence given is the mutant pig ryanodine receptor (RyR1) gene		
CC	from swine cDNA. The polymorphic sites were observed in comparisons		
CC	of Pietrain and Yorkshire breeds. There are 17 polymorphisms between		
CC	the two breeds. The polymorphism at position 1972 causes a mutation		
CC	from Arg to Cys and this is thought to be the molecular basis of		
CC	porcine malignant hyperthermia (MH). This mutation lies within the		
CC	region of RyR1 that is concerned with the binding of regulators of Ca2+		
CC	release channel gating. Analysis of surrounding sequences suggests		
CC	that this mutation lies within a beta strand domain comprising roughly		
CC	of amino acids 520 to 830. RyR1 is the calcium release channel of the		
CC	sarcoplasmic reticulum and is a large protein which spans the gap		

CC between the transverse tubule and the sarcoplasmic reticulum. The  
CC channel is activated by ATP, calcium, caffeine, and micro-molar  
ryanodine. It is inhibited by ruthenium red, tetracaine, calmodulin,  
CC high Mg<sup>2+</sup> and ryanodine.

PT	New nucleic acid encoding opioïd receptor - and related
PT	polypeptide, antisense nucleic acid, probes, recombinant cells
PT	and ligands, useful in diagnosis and treatment of e.g.
PT	neurological disorders
PS	Claim 3; Page 16-18; 29pp; French.
CC	A cDNA bank constructed from hybridoma NG108-15, was used to
CC	transfect COS-1 cells. The cells were tested for ability to bind
CC	tritium-labelled Tyr-D-Thr-Gly-Phe-Ieu-Thr. In the presence or
CC	absence of the opioïd antagonist naloxone. Clone K56 was isolated
CC	from a positive colony and found to contain a 2216bp insert. This
CC	cDNA encodes a delta opioïd (enkephalin) receptor with apparent
CC	dissociation constant 1.4nM and Bmax 3.9-6.4 pmoles/mg protein.
SC	Sequence 2216 BP; 460 A; 647 C; 649 G; 460 T;

PT	Nucleic acid molecule encoding vertebrate pheromone receptor -	
PT	useful to identify modulators for control of reproductive and social	
PT	behaviour, fertility and hormone secretion	
PS	Claim 1; Fig 8; 123pp; English.	
CC	A cDNA clone (T69545) codes for rat pheromone receptor VN1	
CC	(W19103), a member of a novel family of presumed 7-transmembrane	
CC	domain receptors that are evolutionarily independent of the odorant	
CC	receptors of the main olfactory epithelium (MOE). It was isolated	
CC	by differential screening of cDNA libraries constructed from rat	
CC	single vomeronasal sensory neurons. A VN1 insert in pBluescript	
CC	has been deposited as ATCC 97294. VN1 is expressed only in about	
CC	4% of VSN and never in the MOE. cDNA clones for VN2-7 were obt.	
CC	by PCR and hybridisation (see also T69546-50, VN2 sequence not	
CC	given). VN polypeptides (W19103-09) can be expressed in host-	
CC	vector systems for use in identifying modulators for control of	
CC	maternal, reproductive and social behavior, to increase fertility,	
CC	control hormone secretion and to regulate food uptake in humans and	
CC	animals. A human homologue, HG25 (T69551), has also been obt.

PT Tumour suppressor pRb2/p130 gene intron and promoter sequences -

PT pre-disposition to cancer and prognosis of cancer and predicting

PS Clam 63; Page 113; 169pp; English.

CC This genomic DNA sequence comprises intron 13 of the human

CC tumour suppressor pRb2/p130 gene that plays a key role in cell

CC cycle progression. The gene was isolated from a human pl genomic

CC library using primers (see T96897-98) based on the published cDNA

CC sequence, with the 5' flanking region obtained from a placenta

CC genomic library. The expression level of the pRb2/p130 gene in a

CC sample from a patient can be determined and used to: (1) determine

CC a prognosis in a patient afflicted with cancer; (ii) detect a

CC cancerous disease state in a tissue; (iii) identify individuals at

CC risk for cancer, or individuals at risk for the recurrence of

CC cancer after treatment; or (iv) grade a cancer: where the level of

PT New epithelial growth factor receptor homologue HER3 - used to
PT diagnose and treat conditions involving HER3, EGFR and HER2-neu
PT e.g. neoplastic diseases.
PS Claim 1: Fig 1: 20pp; English.
CC The sequence encodes an HER3 precursor and can be obt'd. from cell
CC sources which produce HER3-like activities and/or express HER3
CC encoding mRNA, e.g. epidermoid and breast carcinoma cell lines, or
CC normal colon, kidney and brain. The HER3 DNA can be used to detect
CC and quantify mRNAs encoding HER3. HER3 mRNA levels may indicate
CC emerging and/or existing neoplasias as well as the onset and/or
CC progression of other human diseases. Anti-sense HER3 RNA mols. may
CC be useful therapeutically to inhibit the translation of HER3
CC encoding mRNAs to eliminate the presence of HER3. They may also be
CC useful in elucidating HER3 functional mechanisms.

PT New bone related, cadherin-like OSF-4 proteins - for treatment
PT and diagnosis of bone metabolic disease, and nucleic acid
PT encoding them
PS Claim 3: Page 13-17, 34pp; English.
CC cDNA libraries were constructed from the mouse osteoblastic cell
CC line MC3T3-E1 and from mouse liver tissue, amplified by PCR, and
CC then as much common DNA as possible removed by hybridisation between
CC the 2 libraries. Residual E1-specific DNA was amplified, inserted
CC into lambda gt10 and screened by plaque hybridisation. A minibank of
CC 273 E-specific clones was recovered, their inserts amplified and
CC used to screen total RNA from both cell types. One clone specific
CC for E1 was identified and sequenced. The insert from this clone was
CC cloned to screen cDNA prepd. from E1 RNA and the longest posn. insert
CC used in pGEM 112f (+) to give pK0164. This insert was sequenced;
CC it encoded the 795 AA mouse precursor protein (044391/R49730). The
CC insert was also used to screen a cDNA bank prepd. from human
CC osteosarcoma to identify 2 clones encoding the 2 human precursor
CC proteins - OSF-4-1 and OSF-4-2 (044392/R49731 and 044393/R49732
CC respectively).

FT      PT Screening for the possibility of testicular seminoma and other
FT      cancers - using MAGE-Xp gene primers
FT      PS Claim 7, Pages 22-34; 40pp; English.
FT      CC This is the MAGE-B cluster DNA sequence. The invention provides a novel
FT      CC method for screening for the possibility of a testicular seminoma,
FT      CC non-small cell lung carcinoma, melanoma, breast cancer, sarcoma, or
FT      CC leukaemia in a sample. The method comprises contacting the sample with
FT      CC at least one nucleic acid molecule which hybridises to mRNA corresponding
FT      CC to an MAGE-Xp gene, and determining hybridisation as a determination of
FT      CC possible presence of testicular seminoma, non-small cell lung carcinoma
FT      CC melanoma, breast cancer, sarcoma, or leukaemia in the sample. By assaying
FT      CC for the MAGE-B1 gene, or MAGE-B2 gene, both contained within this 40352
FT      CC base pair MAGE-B cluster DNA sequence, the presence of such cancers in a
FT      CC sample can be determined. The genomic DNA that encodes the MAGE-B2 gene
FT      CC consists of nucleotides 3266-7979 of this MAGE-B1 cluster DNA sequence.
FT      CC The nucleic acid molecule that encodes a MAGE-B1 gene, consists of, in
FT      CC 5' to 3' order, nucleotides 31403-31474, 33958-34062, 35057-35139, and
FT      CC 38088-39691, nucleotides 31403-31474, 33958-34062, and 38088-39691,
FT      CC nucleotides 35057-35139 and 38088-39691, and nucleotides 33958-34062 and
FT      CC 38088-39691 of this sequence. The primers specific for the MAGE-B
FT      CC gene can be used in a kit to amplify a MAGE-B gene.

PT DNA encoding cobra C3, CVF 1 and CVF 2 - which are used in the
PT treatment of cancer
PT Claim 1; Fig 2A-2L; 155pp; English.
PS This sequence encodes the cobra C3 (third component of complement).
CC The cDNA sequence of cobra C3 shows a high sequence homology with C3
CC molecules from human, mouse, rat and X. laevis. Cobra C3 is
CC synthesised as a pre-pro molecule that is subsequently processed
CC into the mature two-chain protein by removing the signal peptide and
CC the four Arg residues between the beta and alpha chain. The alpha
CC chain comprises 992 amino acids and the beta chain comprises 633
CC residues, being 12 residues shorter than the human beta chain. Cobra
CC C3 has a different codon usage compared to mammalian C3 mRNAs. The
CC G+C content of all known mammalian C3 mRNAs is more than 53%. The
CC G+C content of cobra C3 mRNA is significantly lower at 43%. The
CC significance of this difference is not known. C3 is thought to have
CC important functions in the immune response and host defence.

PT DNA encoding cobra C3, CVF 1 and CVF 2 - which are used in the
PT treatment of cancer
PS Claim 3; Fig 2M-2J(10); 155pp; English.
CC This sequence encodes the cobra venom factor 1 (CVF1). The CVF1
CC protein is contained within cobra venom and is a structural analog of
CC cobra C3 (third component of complement). It is thought that CVF1 and
CC C3 are derived from different but related genes. The thioester site
CC and factor H binding site of C3 and CVF1 are very similar, even though
CC neither are actually present in the mature CVF1 protein. Factors H and
CC I are able to regulate the activity of complement by dissociating C3b,
CC Bb, and by cleaving C3b. CVF1 is resistant to this regulation. CVF1
CC and CVF2 may be used in the treatment of cancer by linking them to
CC an antibody which recognises a specific tumour cell. As CVF1 and CVF2
CC are insensitive to factor H control this method will lead to the
CC selective destruction of cancer cells.

PT DNA encoding cobra C3, CVF 1 and CVF 2 - which are used in the
PT treatment of cancer
PS Claim 5; Fig 2M-2V; 155pp; English.
CC This sequence encodes the C-terminal portion of cobra venom factor
CC 2 (CVF2). A full length sequence encoding pre-pro CVF2 may be
CC constructed by ligating this sequence to the 3' end of the 1-964 bp
CC fragment derived from CVF1 (see also 077790). CVF2 is active in both
CC its glycosylated and unglycosylated states. Factors H and I are able
CC to regulate the activity of complement by dissociating C3b, Bb, and by
CC cleaving C3b. CVF2 is resistant to this regulation. CVF1 and CVF2 may
CC be used in the treatment of cancer by linking them to an antibody which
CC recognises a specific tumour cell. As CVF1 and CVF2 are insensitive to
CC factor H control this method will lead to the selective destruction of
CC cancer cells.

PT Isolated nucleic acid molecule, used to produce transgenic plants -
PT comprises nucleotide sequence encoding polypeptide having soluble
PT starch synthase activity, where polypeptide is encoded by maize gene
PS Claim 1; Column 25-28; 29pp; English.
CC The present sequence represents an isolated nucleic acid molecule which
CC has been isolated and comprises a nucleotide sequence encoding a
CC polypeptide having soluble starch synthase (SSS) activity, where the
CC polypeptide is encoded by a maize gene. The isolated nucleic acid
CC molecule can be used to produce transgenic plants with altered starch
CC production. The transgenic plants produced using the nucleic acid
CC molecule have an enhanced ability to produce structurally-altered starch.

PT Hybrid human and porcine factor VIII - having high coagulant  
PT activity, used for treating patients with factor VIII deficiency  
PT Partic. haemophilia  
PS Claim 29; Page 52-53; 94pp; English.  
CC Hybrid human/porcine factor VIII molecules are claimed. These can be  
CC obtained by (1) substituting a porcine subunit (i.e. heavy or light  
CC chain) for the corresp. human subunit; (2) substituting a porcine  
CC domain (i.e. A1, A2, A3, B, C1 and C2) for the corresp. human domain;  
CC (3) substituting part of a porcine domain for the corresp. human  
CC domain or (4) changing residues in the human sequence to the corresp.  
CC porcine residues. The hybrid factor VIII molecules have greater  
CC clotting activity than human factor VIII and are more resistant to  
CC factor VIII inhibitors. Nucleic acid coding for the A2 domain of  
CC porcine factor VIII, homologous to residues 372-740 in mature human  
CC factor VIII, is also claimed.

PT Nucleic acid encoding porcine factor VIII - used to obtain  
PT porcine and human-porcine chimeric factor VIII for treating  
PT haemophilia  
PS Claim 2; Page 43-45; 61pp; English.  
CC A partial genomic clone for the porcine factor VIII B domain was  
CC obtd. as described in US Patent No. 4,757,006, and included an  
CC intron connected to another exon presumed to be in the A2 domain.  
CC An oligo probe corresp. to the thrombin cleavage site at the COOH  
CC terminus of porcine factor VIII A2 domain was designed corresp. to  
CC 066617. This sequence (P831) was derived from a porcine genomic  
CC clone that contains the protein sequence EPRSL and corresp. to  
CC AAs 738-743 of the human protein. This probe, in combination with  
CC degenerate oligo probes made against various sequences of the A1  
CC domain of human factor VIII, was used to amplify the corresp.  
CC sequences for porcine factor VIII. Examples of sequences used to  
CC isolate a porcine fragment are P857 (066618) and P854 (066619).  
CC RNA was prepd. from porcine liver and converted to cDNA. It was  
CC PCR amplified with 5' oligo P854 and 3' oligo P831.  
CC The results are set forth in 066616. Chimeric forms of factor  
CC VIII include those where various domains of the human factor  
CC factor VIII domains, and include, chimeric forms where the A1  
CC and/or A2 domains, in whole or in part, of the human factor VIII  
CC sequence have been replaced, in whole or in part, by the A1 and/or  
CC the A2 domains of porcine factor VIII. Specifically provided are  
CC chimeric factor VIII sequences comprising the A1, A2, A3, B, C1 and  
CC C2 human domains as set forth in 066615, where the A1 and/or A2  
CC domains, as well as other segments, such as the regions corresp. to the  
CC AA numbers 336-372, 336-740, 372-740, 700-740 and combinations of these  
CC regions have been replaced in whole or in part with porcine factor  
CC VIII sequences as set forth in 066616 and R55353.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see <http://www.nhgri.nih.gov/DIR/GRB/CHR/> or send an E-mail to [egreen@nhgri.nih.gov](mailto:egreen@nhgri.nih.gov)

**SOURCE INFORMATION:**

This clone is from a release of the human BAC library. The library contains cloned DNA from a human sperm. See: Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); Kim et al., Genomics 34:213-8 (1996). The clone is available from Research Genetics, Inc. (<http://www.resgen.com>).

VECTOR: pRelBAC11

Selection: chloramphenicol

**NEIGHBORING SEQUENCE INFORMATION:**

Actual start of this clone is at base position 1 of H\_RG308B22; actual end is at 148416 of H\_RG308B22. The orientation of this cosmid is unknown.

This clone contains the STS SWSS3356 (NID:g1113751), SWSS2791 (NID:g113586).

mailto:sapiens@wustl.wustl.edu

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:  
all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

NEIGHBORING SEQUENCE INFORMATION:  
The actual start of this clone is at base position 1 of H\_RG191D16;  
the actual end is at base position 174952 of H\_RG191D16. The orientation of this clone is unknown.

The location of this clone is unknown.

Sequencing is completed to a minimum standard of double strand
coverage with a minimum of 2 clones and 2 reads with no ambiguities
or 2 chemistries with a minimum of 2 clones and 3 reads with no
ambiguities. If the sequence quality does not meet this standard,
it will be indicated in the annotation.

The repeat regions shown were identified using RepeatMasker by
Adrian Smit.

Sequence similarities were identified using Powerblast by Jinghui
Zhang.

Exon/Intron boundaries of identified genes were chosen if there
were canonical splice junctions that maintained sequence continuity
across the splice junctions.

Beginning of sequence overlaps with AF007262, end of sequence
overlaps with AF011889.

clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: [http://gc.bcm.tmc.edu:8088/quality\\_info/genbank.annotation.html](http://gc.bcm.tmc.edu:8088/quality_info/genbank.annotation.html).

Title: US-09-049-696-6

Perfect score: 252

Sequence: 1 CAAAGATGTGTGTTAGT.....GAGGACGTCACCTGCAGC 252

Scoring table: OLIGO\_NUC

Searched: 311585 seqs, 125096042 residues

Database: N\_Geneseq\_36:\*

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

PT	New beta sub-unit of sodium-glucose co-transporter - and DNA						
PT	encoding it, useful for regulating glucose absorption and						
PS	excretion, esp. in diabetes						
PS	Claim 1; Fig 6; 18pp; German.						
CC	A pig renal cortex cDNA bank was screened with antibody R446						
CC	directed against porcine sodium ion-glucose cotransporter. Positive						
CC	clone p20 containing a 4.5kb insert was isolated. The insert						
CC	encodes a single polypeptide of mol.wt. 70000. Using p20 cDNA as						
CC	template, cRNA was transcribed and found to significantly increase						
CC	glucose uptake when injected into Xenopus oocytes of low endogenous						
CC	transport activity. The porcine gene sequence was also used to						
CC	design PCR primers for isolating the human sodium-glucose						
CC	cotransporter beta-subunit. See Q46122 and Q46123.

 PT Expression of phosphorylated exogenous protein - in host cells  
 PT transformed with two vectors, one for the protein, the other for  
 PT catalytic domain of protein kinase  
 PS Disclosure; Fig 3; 55pp; English.  
 CC This sequence represents the elk cDNA which encodes the protein  
 CC tyrosine kinase, Elk. The Elk gene, BI, encode a protein which is  
 CC a member of the Eph subfamily of protein tyrosine kinases. The Elk  
 CC product is very similar to two other receptor-like tyrosine kinases,  
 CC eph and eck. Lambda-BI-Elk may be used in the production of  
 CC phosphorylated exogenous protein along with a further vector encoding  
 CC the desired exogenous protein. These plasmid may be used to produce  
 CC phosphorylated proteins in host cells which have no intrinsic capacity  
 CC for phosphorylation, eg. bacteria. The system may be used for the  
 CC expression of the phosphorylated kinase insert domain of a growth  
 CC factor receptor kinase eg. platelet-derived growth factor receptor.

PT DNA fragment comprising human immunoglobulin Vh genes - for the  
PT production of human immunoglobulin in mammalian hosts  
PS Claim 36; Page 66-67; 130pp; Japanese.  
CC A series of genes (Q78339-79002) encoding human immunoglobulin variable  
heavy chains. The genes were isolated and cloned from a series of cosmid  
constructs: Y202; Y103; Y21; Y6; Y24; 3-31; M84; M18 and M131, by PCR  
amplification using primers Q78917-38. The genes are subdivided into 5  
families of Vh genes. The fragments cover a region of 800 kb. The DNA  
fragments were isolated from high molecular weight DNA from human  
placenta. The DNA was partially digested with RsaI restriction enzyme.  
The fragments were separated by gel electrophoresis and 35-45 kb fractions  
were collected. The fragments were ligated with ClaI-digested cosmid  
vector pUB81. The ligation products were in vitro packed and infected  
into E.coli 490a. The fragments were then subcloned by colony  
hybridisation. The Vh genes and the DNA fragments encoding them are  
useful in producing human immunoglobulin in mammalian hosts.

PT Isolated polycystic kidney disease 1 gene and its mutants - useful  
PT for treatment and diagnosis of autosomal dominant polycystic kidney  
PT disease  
PS Claim 2; Fig 10; 119pp; English.  
CC A polycystic kidney disease 1 (PKD1) cDNA contig (Q91438) relates  
CC to the entire PKD1 gene sequence apart from the extreme 5' end.  
CC The sequence is compiled from a cDNA contig (see Q91339) obt'd. from  
CC chromosome 16, and various other isolated cDNA and genomic DNAs.  
CC A chromosome translocation associated with autosomal dominant  
CC polycystic kidney disease (ADPKD) disrupts the PKD1 candidate region  
CC at 16p13.3. The PKD1 gene codes for a novel protein (R75916).  
CC Screening for normal or mutated PKD1 can be used for diagnostic

CC purposes, and disorders such as ADPKD may be treated or prevented by  
CC PKD1 gene therapy.

PT Isolated polycystic kidney disease 1 gene and its deletion mutants  
PT - useful in diagnosis and treatment of PKD1-associated disease and  
PT in gene therapy.  
PS Claim 2; Fig 15; 181pp; English.  
CC The human PKD1 gene (T13821), located on chromosome 16, encodes  
CC a polypeptide (W00870) that has a role in the prevention or  
CC suppression of adult polycystic kidney disease (APKD). The  
CC chromosome 16 translocation breakpoint was located in 2 members  
CC of an APKD family and the gene disrupted by the rearrangement was  
CC defined. The discovery of additional mutations of the gene in  
CC other PKD1 patients confirmed the identity of the gene. Full  
CC characterisation of the transcript was difficult because all but  
CC 3.5 kb at the 3' end is encoded by a region that is reiterated  
CC several times elsewhere in the chromosome. The PKD1 gene can  
CC be used in gene therapy, as a probe to detect PKD1-associated  
CC diseases, or to produce the PKD1 polypeptide.

PT Isolated human polycystic kidney disease and its mutants  
PT useful for treatment of polycystic kidney disease and screening for  
PT carriers  
PS Claim 1: Fig 1; 65pp; English.  
CC The present sequence is that of the normal human PKD1 gene from  
CC chromosome 16. Mutations in this gene (e.g. transitions,  
CC transversions, deletions and/or insertions) are associated with  
CC adult-onset polycystic kidney disease (APKD). The PKD1 locus is  
CC GC-rich (62.4%). Comparison of this sequence with a previously  
CC reported partial cDNA sequence revealed differences at three  
CC locations (see features table). The most significant difference is  
CC the presence of two additional cytosine residues on the plus-strand  
CC at position 4566 of the previously reported sequence. The insertion  
CC results in a frame-shift in the predicted protein coding sequence,  
CC leading to replacement of 92 C-terminal amino acids with a novel  
CC 12 amino acid C-terminus. The PKD1 gene contains 23 Alu repeats.  
CC There is a region consisting of 17 tandem copies of a perfect 27 bp  
CC repeat and two large CT-rich regions.

PT System for expressing heterologous gene or protein exclusively in  
PT mature T cells - includes enhancer from a CD4 gene, also transformed  
PT haematopoietic cells, esp. for selective destruction of activated T  
PT cells  
PS Claim 2: Fig 6; 51pp; French.  
CC A heterologous gene or protein is expressed only in mature T cells  
CC by transducing haematopoietic cells (especially stem cells) with a  
CC recombinant vector which includes all sequences needed for expression  
CC and at least one enhancer from a CD4 gene from the same or different  
CC species. The enhancer confers specific expression in mature (but not

CC immature) T cells. The system is used in gene therapy for selective  
CC destruction of activated T cells, particularly to prevent graft  
CC rejection or guest versus host disease, or to treat or prevent viral  
CC (e.g. HIV) infection, autoimmune disease or primary or secondary  
CC immune deficiencies. The vector preferably contains the human CD4  
CC gene promoter having the present sequence or nucleotides -498 to +16  
CC or -165 to +16 from it. 243 A; 271 C; 300 G; 282 T;

PS Claim 13; Column 11-14; 13pp; English.  
CC A method has been developed for diagnosing X-linked Charcot-Marie-Tooth  
CC disease. The method comprises detecting a mutation in the connexin-32  
CC gene, the mutation being in at least 1 codon selected from 28, 44, 86,  
CC 100, 103, 124, 154, 157, 160, 161, 179, 181, 183, 187, 198, 204, 205,  
CC 219, 230 and 235, where the presence of the mutation in the connexin-32  
CC gene is indicative of X-linked Charcot-Marie-Tooth disease. The present  
CC sequence encodes connexin-32. A method is also described as above except  
CC that the mutation is selected from a change in the nucleic acid sequence  
CC of codon 12 from GGC to GGT (GGC12GGT), ATC28AAC, TGG44ATG, CGG75TGG,  
CC ACC86TCC, CAC100TAC, AAG103GAG, AAG124AG, CGG142CAG, TAA154TAA,  
CC TAC157TGC, TAT160CAT, GCC161GCT, CCG172CTC, TGC199CTG, GTG18ATG,  
CC CGC183TGC, deletion of codon 185, AAA187GAA, TCT198TTT, CTC204GTC,  
CC AAT205AGT, CGC219TGC, CGC307GC and TTC235TGC. The X-linked disease can  
CC be distinguished from other forms of Charcot-Marie-Tooth disease.

PT Human polycystic kidney disease gene, PKD1 - useful to treat and  
PT diagnose human autosomal or adult onset polycystic kidney disease  
PS Claim 4; Pages 119-138; 257pp; English.  
CC The present sequence is the human polycystic kidney disease 1  
CC (PKD1) cDNA. The PKD1 cDNA or polypeptide may be used to treat  
CC autosomal dominant polycystic kidney disease (APKD), and identify  
CC carriers of mutant PKD1 genes, i.e. subjects susceptible to APKD.  
CC Antibodies (Ab) that distinguish between normal and mutant PKD1  
CC sequences can also be used in diagnostic tests. Anti-PKD1 Ab may  
CC also be used to perform subcellular and histochemical localization  
CC studies, and to block the function of PKD1. Ab are also useful in  
CC rational drug design studies to identify and test inhibitors of  
CC PKD1. Sense and antisense sequences derived from the PKD1 gene may  
CC be used for detection and therapy.

PT New nucleic acid encoding Kaposi's sarcoma associated herpes virus  
PT proteins - useful for, e.g. detecting levels of HHV8 in, and  
PT preparation of vaccines for treatment of, HIV patients

PS Example 2; Page 135-203; 230pp; English.  
CC This sequence represents the long unique region and terminal repeat of  
CC the Kaposi's sarcoma-associated herpes virus (KSHV). KSHV is also known  
CC as human herpes virus 8 (HHV8). This sequence contains the DNAs of the  
CC invention which encode KSHV polypeptides selected from: (a) viral  
CC macrophage inflammatory protein (MIP) II; (b) viral interleukin-6 (IL-6);  
CC (c) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or L;  
CC (d) capsid protein IV encoded by ORF5; and (e) immediate early protein  
CC encoded by ORF7. Labelled probes for the nucleic acid, proteins encoded  
CC by it, and antibodies (Ab) specific for the proteins are useful for

CC detecting HHV8, specifically for diagnosis of Kaposi's sarcoma, in body  
 CC fluids or tissue samples. HHV8 infections can be treated with antisense  
 CC or triplex forming molecules or agents that bind specifically to the  
 CC protein. Ab may be used for prophylaxis or treatment of HHV8 infection,  
 CC while the protein can be used in protective vaccines. Ab may also be used  
 CC to differentiate between lymphomas, and HHV8 may be implicated in many  
 CC other lymphoproliferative diseases such as lymphomas, leukaemia,  
 CC splenomegaly and mycosis fungoides. Cells and animals containing the  
 CC nucleic acid are useful for drug screening. HHV8-derived peptides can be  
 CC used as targets for antiviral drugs, e.g. dihydrofolate reductase gene  
 CC can be inhibited with methotrexate. These can also be used to determine  
 CC the immune status of a patient infected with HIV. HHV8 derived protein  
 CC viral MIP III may be used as an anti-inflammatory agent for,  
 CC e.g. treating rheumatoid arthritis. This sequence is stated as containing  
 CC 81 open reading frames. 32579 A; 37795 C; 35758 G; 31375 T;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TITLE        Direct Submission
JOURNAL      Submitted (16-MAR-1999) Drosophila Genome Center, Lawrence Berkeley
AUTHORS      Laboratory, MS 64-121, Berkeley, CA 94720, USA
COMMENT      On Jun 1, 1999 this sequence version replaced gi:4803907.
              For further information about this sequence, including its location
              and relationship to other sequences, please visit our sequence
              archive Web site (http://www.fruitfly.org/sequence/) or send email
              to dbd@fruitfly.berkeley.edu. All contigs in this submission meet
              the following cutoffs: length >= 400 bases, phrap computed error
              rate <= 1/10.
              * NOTE: This is a 'working draft' sequence. It currently
              * consists of 3 contigs. The true order of the pieces
              * is not known and their order in this sequence record is
              * arbitrary. Gaps between the contigs are represented as
              * runs of N, but the exact sizes of the gaps are unknown.
              * This record will be updated with the finished sequence
              * as soon as it is available and the accession number will
              * be preserved.
              * 1 733: contig of 733 bp in length
              * 734 813: gap of unknown length
              * 814 41210: contig of 40397 bp in length
              * 41211 41290: gap of unknown length
              * 41291 169526: contig of 128236 bp in length.

TITLE Direct Submission  
JOURNAL Submitted (20-AUG-1998) E-mail enquiries: humquerry@sanger.ac.uk  
COMMENT  
Submitted (20-AUG-1998) E-mail enquiries: humquerry@sanger.ac.uk  
Clone requests: clonerequests@sanger.ac.uk  
On Aug 21, 1998 this sequence version replaced gi:3281981.  
During sequence assembly data is compared from overlapping clones.  
Where differences are found these are annotated as variations  
together with a note of the overlapping clone name. Note that the  
variation annotation may not be found in the sequence submission  
corresponding to the overlapping clone, as we submit sequences with  
only a small overlap as described above.  
IMPORTANT: This sequence is not the entire insert of clone 544A11.  
It may be shorter because we only sequence overlapping sections  
once, or longer because we arrange for a small overlap between  
neighbouring submissions.  
The true left end of clone B42B1 (275890) is at 21055 in this  
sequence. The true left end of clone 732E4 (AL008722) is at 113044.  
The true right end of clone B42B1 is at 62012.  
This sequence has been finished according to sequence map criteria  
as follows. An attempt is made to resolve all sequencing problems,  
such as compressions and repeats, but not necessarily within known  
annotated human repeat sequence elements (e.g. Alu). Where the  
sequence is ambiguous, there is an annotation using the 'unsure'  
feature key.  
This sequence was generated from part of bacterial clone contigs of  
human chromosome 22, constructed by the Sanger Centre Chromosome 22  
Mapping Group. Further information can be found at  
http://www.sanger.ac.uk/HGP/Chr22  
544A11 is from the human BAC library described in U-J. Kim et al.  
(1996) Genomics 34, 213-218. VECTOR: pELOBAC11.

Stone, N.E., Schmutz, J.J., Cox, D.R. and Myers, R.M.  
Direct Submission  
Submitted (21-JAN-1999) Department of Genetics, Stanford Human  
Genome Center, 855 California Avenue, Palo Alto, CA 94304, USA  
On Jun 8, 1999 this sequence version replaced gi:4966377.

\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 12 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

PT	Human colon specific genes and their expression products - detection	
PT	of which, in non-colon tissue samples, can be used as indication of	
PS	colon cancer metastasis	
PS	Claim 1: Fig 5; 60pp; English.	
CC	13 cDNA clones (T45880-92), most of them partial clones, correspond	
CC	to human colon specific genes, designated CSG1, CSG2, etc., that	
CC	are primarily expressed in tissues derived from the colon. CSG7	
CC	and CSG10 show reduced expression in colon cancer cells as compared	
CC	to that in normal cells; the remaining genes are overexpressed in	
CC	colon cancer. The partial cDNA sequences can be used to isolate	
CC	full-length clones and genomic clones including the complete gene.	
CC	CSG nucleic acids can be used to produce CSG polypeptides (see also	
CC	W06545-53) in transformed host cells, as probes to detect disorders	
CC	of the colon, partic. colon cancer and colon cancer metastasis, and	
CC	in gene therapy.

PT Colon-specific nucleic acids - useful as probes for detecting colon  
PT cancer micrometastases  
PS Claim 15; Fig 5A-B; 51pp; English.  
CC V16666-81 represent polynucleotide sequences of partial or full-length  
CC cDNA clones of colon-specific genes. The polynucleotides can be used  
CC as probes to detect expression of the corresponding human genes, e.g. in  
CC diagnostic assays for detecting micrometastases of colon cancer.  
CC Recombinant cells containing the polynucleotides can be used to  
CC produce the polypeptides, in order that antibodies can be raised and  
CC used in further screening or diagnostics.

PT New isolated cancer associated nucleic acids and polypeptides -  
PT isolated using sera from cancer patients, used to develop products  
PT for the diagnosis, monitoring or treatment of cancers  
PS Claim 67; Page 629; 787pp; English.  
CC The invention relates to a method for diagnosing a disorder characterised  
CC by expression of a human cancer associated antigen precursor coded for by  
CC a nucleic acid molecule (NAM). The method comprises: (a) contacting a  
CC biological sample isolated from a subject with an agent that specifically  
CC binds to the NAM, an expression product or a fragment of an expression  
CC product complexed with an HLA molecule; and (b) determining the  
CC interaction between the agent and the NAM or the expression product as a  
CC determination of the disorder. The products and methods can be used in  
CC the diagnosis, monitoring, research, or treatment of conditions  
CC characterised by the expression of various cancer associated antigens.  
CC The invention provides nucleic acid sequences and encoded polypeptides  
CC which are cancer associated antigen precursors expressed in human breast  
CC cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and  
CC lung cancer.

PT New polynucleotides encoding human secreted proteins - derived from
PT e.g. human blood, kidney, foetal lung, placenta, testes, brain,
PT ovary, pituitary, retina and colon cDNA libraries
PS Claim 1: Page 394-395: 633pp: English.
CC This sequence represents an expressed sequence tag (EST), and is a
CC polynucleotide of the invention. The polynucleotides of the invention are
CC all secreted EST sequences isolated from a variety of human tissue
CC sources. The EST sequences and proteins encoded by them are predicted to
CC have useful biological activities which would make them suitable for
CC treating, preventing or ameliorating medical conditions in humans and
CC animals, although no supporting data is given. Suggested activities
CC include nutritional activity, immune stimulating or suppressing activity,
CC haematopoiesis regulating activity, tissue growth activity,
CC actinin/inhibin activity, chemotactic/chemokinetic activity, haemostatic
CC and thrombolytic activity, receptor/ligand activity, anti-inflammatory
CC activity, cadherin/tumour invasion suppressor activity, tumour inhibition
CC therapy. The EST sequences are also stated to be useful for gene

PT Recombinant nucleic acid contg. modified tospovirus sequence - used  
PT to prepare plants resistant or tolerant to tospovirus  
PS Claim 1; Page 14-16; 38pp; English.  
CC A DNA sequence (T38305) is complementary to one which encodes  
CC the tomato spotted wilt virus M-RNA sequence which itself encodes  
CC the putative viral movement protein. A recombinant nucleic acid

CC contains a transcriptional regulatory region and, under its  
CC control, the tospovirus sequence, pref. modified by removal or  
CC inactivation of the start codon, and insertion or deletion of  
CC nucleotides 3' of the start codon to alter the reading frame of the  
CC encoded RNA. A plant having such a construct stably integrated and  
CC expressed in its genome is resistant to, or tolerant of,  
CC tospoviruses.

PT ovary, pituitary, retina and colon cDNA libraries.  
PS Claim 1; Page 99; 61pp; English.

CC The present sequence represents a human expressed sequence tag (EST).  
CC The polynucleotide, which is a secreted EST, and the encoded protein  
CC are predicted to have useful biological activities which would make  
CC them suitable for treating, preventing or ameliorating medical  
CC conditions in humans and animals, although no supporting data is  
CC given. Suggested activities include nutritional activity, immune  
CC stimulating or suppressing activity, haematopoiesis regulating  
CC activity, tissue growth activity, activin/inhibin activity,  
CC chemotactic/chemokinetic activity, haemostatic and thrombolytic  
CC activity, receptor/ligand activity, anti-inflammatory activity,  
CC cadherin/tumour invasion suppressor activity, tumour inhibition  
CC activity. The polynucleotide may also be useful for gene therapy.
